reach the coasts that lie N. and S.; thus making a primary division of the country into four quarters (herdings), which are distinguished by the four points of the compass towards which they lie. The whole island can be considered only as one vast mountain, interspersed with long and deep valleys, concealed in its bosom heaps of minerals, of vitriolic and bituminous substances, and rising on all sides out of the ocean in the form of short blunted cones. Earthquakes and volcanoes have through all ages decorated this unhappy island, "while it abounds in sulphur and subterranean fires, and volcanoes appear in every quarter. It would be too bold a theory (says Pinkerton), to suppose that so wide an expanse was expelled from the sea; not to mention that the furthurhand, or carbonated wood, found at a great depth, evinces a most remote vegetation. The highest mountains clothed with perpetual snow are styled "Yokuls;" and of these Saxnifs, hanging over the sea in the S.W. part of the island, is esteemed the highest, being computed at 6850 feet. The mountains are said to be chiefly sand-stone, pudding-stone, with petro-flex, flatilete, and argilaceous feluitus. The calcareous spar of Iceland is celebrated since the days of Newton for its double refraction: calc-dony, zeolite, lava, pumice, black obilidian, and mallechite, or copper fluitites, are among a thousand productions." Of Hecla we have already given an account under that article. The mountains of Krabla, near Mywata, in the N.W., and of Kattlega, were more known than Hecla by their eruptions in the 18th century. The mountains of Iceland exhibit indications of their containing iron, copper, and silver ore. In this island there are no salt springs, but salt has been found at the foot of the volcanoes or burning mountains. Woods rarely occur, but many large trees are driven lither by the sea, especially on the N. coast, where, for want of clipping to export it for sale, it is suffered to lie and rot. Shrubs, on which grow all sorts of berries, as juniper-berries, black-berries, &c. are burnt in great abundance every year for charcoal, used by the natives in their forges. On some of the mountains, many of which, consisting merely of rocks and sand, are barren, there are plains of several miles in extent covered with verdure and producing fine grasses; between other mountains intermixed over the island, there are valleys which afford plentiful nourishment for cattle. The finest pastures are in the northern parts of the island, where the grasses springs rapidly and to a great height. The cattle are generally driven among the mountains to graze, where they find good pasture; but the grasses that grows near the habitations of the Icelanders is reserved for winter fodder. Iceland, though a very mountainous country, is interfaced with roads which are passable for horses; and carriages, which were formerly used, being now laid aside, some hundreds of pack-horses pass annually over the mountains from the north to the trading places in the south parts of the island; and these are loaded with butter, woollen manufactures, &c. which are marketed for other commodities. The boiling springs of Iceland present a singular phenomenon; that of Geyser to the N. of Skalfholt is the most remarkable, rising from an aperture 10 feet in diameter, and spouting at intervals to the height of 50 or even 90 feet. The chief rivers of Iceland are in the exit; the Skalland, the Oxarbird, and the Brun, all flowing from the S. to the N. some are white with lime, and others filled with sulphur. The common fuel of the country is turf, some of which emits a strong sulphureous smell; and even the bones are burnt in some parts of the island. Iceland affords a great variety of fabulous and medicinal herbs; bread is little known among the common people, who cannot purchase that which is imported into the harbours; but subsist chiefly on fresh and dried fish, and also on milk, oatmeal, and wheats. In times of scarcity they are constrained to prepare flour of various plants described by Von Troil; and their common drink is milk, and also a liquor called "Syra," which is four parts, kept in casks and left to ferment; beer being scarce. Bears are frequently driven to this island in the large flakes of ice from Greenland; but they are destroyed by the inhabitants; so that the only wild beasts to be seen in the island are brown and white foxes. The horses are small, but strong and mettlestone; and those that are broken for the saddle excepted, they lie in the open air through the year, and subsist in winter on the fodder which they can scrape from under the ice and snow. Sheep are numerous, so that a single person pofflefls a flock of three, four, or five hundred. In winter they are driven to shelter at night, and also in very severe weather during the day. Their large caves afford convenient places of reftort. In winter the sheep are occasionally turned out, when the weather is fair and mild, to pick up what they can find under the snow; and if at such times they are surprised by a great fall of snow, they form themselves into a compact body, laying their heads together in the centre; and thus arranged they are covered with snow, and become almost insensible to the cold, so as to be unable to sustain themselves without the assistance of their owner. In this season of hunger and diftreff, they have sometimes been known to eat one another's wool. Goats in this island are few. Some of the Iceland oxen and cows have no horns; and in the southern parts they are fed with filth bones, and the water in which the fish was boiled. Here are no hogs; few cats; but dogs are numerous. Poultry and tame fowl are scarce, the feeding of them being dear; swans, wild geese, and ducks are plentiful; and among the latter we may mention the eider, the eggs and feathers of which are so much valued. Snipes, woodcocks, &c. are also found in this island. The birds of prey are the eagle, hawk, raven, and falcon, the latter being reckoned the best in Europe. The rivers, lakes, and bays, with the other parts of the sea, supply the natives with various sorts of fish in great abundance. The cod-fishery near Iceland begins at the point of Bredervick, and ends at that of Langarnef, running by Cape North and the Isle of Grims, and has occupied more than 200 Dutch vessels and about 50 French. The Icelanders are naturally robust and vigorous; but their strength is soon exhausted by the hardships they endure at sea in their fisheries; so that about the age of fifty years they are generally afflicted with disorders of the breath and lungs, and very attain to advanced age. In the middle of the 14th century this island was greatly depopulated by a pestilence called the "Black death," and in 1784 a dreadful mortality carried off 19,488 horses, 6850 beeves, 129,047 sheep, if the account given by Batteau (vol. i.) be not exaggerated. The exports from Iceland are principally dried fish, salted mutton, beef, butter, tallow, salt, coarse and fine jackets of wadman, woollen stockings and gloves, red wool, sheep-skins, fox-tails of various colours, feathers, and particularly eider-down, gulls, falcons, and hawks. The imports to Iceland are chiefly iron, horses' thoes, timber, meal, bread, brandy, wine, tobacco, coarse linen, a few silk fluffs, and domestic utensils. The first inhabitants of Iceland were a colony of Norwegians, who, to withdraw themselves from the tyranny of Harold Harfagre, retired thither in the year 874. The government was an aristocratic republic for about 357 years, till in 1261 it submitted to Norway. The present inhabitants, being of Norwegian extract, have few peculiar manners; but retain more of the ancient dress and customs of their
their ancestors. The Icelandic language is the most ancient and venerable, and of course the purest dialect of the Gothic. It has engaged the attention of many profound scholars, who have considered it as the parent of the Norwegian, Danish, and Swedish, and in a great degree of the English, though this last may probably be more connected with the Frisian, and other dialects of the north of Germany. In the ancient Icelandic the Lord's prayer is as follows:

In Iceland, extraordinarily as it may seem, letters flourished in a very high degree from the 11th to the 14th century; and independent of the fabulous fagans, which were very numerous, the solid and valuable works then produced in that island might fill a considerable catalogue. From Iceland we derived the "Edda" (which fee), and our knowledge of the ancient Gothic mythology. From Iceland the Swedes, Norwegians, Danes, and Oreadians, drew their chief intelligence concerning their ancient history: Snorri in particular being inflamed the Herodotus of the North; and the Landnams, or book of the origins of Iceland, is an unique work, displaying the names and property of all the original settlers, and the circumstances attending the distribution of a barbaric colony. There still exist in Iceland a bath, built by Snorro, in the 13th century; but the edifices being of timber, no remains of them exist.

In this island there are properly no towns; Nevertheless the houses of the Iceland company, supposing on account of its commercial monopoly in 1750, at the twenty-two ports or harbours, of which there are three or four at each harbour, have been dignified with the appellation of towns; though they are only trading places. We have already said that Iceland consists of four quarters, separated from one another by ridges of mountains. The north quarter constitutes the diocese of Holun, containing 146 churches. The other three quarters are included in the diocese of Skoldholt, to which belong 163 churches. These two bithopries are only valued at 150 each. The religion of this island as well as of the Danish dominions to which it belongs, is the Lutheran. Iceland was converted to Chriftianity at the same period with Norway, in the reign of Olaf I. There are two Latin schools maintained at the royal expense in Iceland. The winter feaon in this island is unexpectedly moderate, so as generally to permit the natives to cut turf even in January. In this extensive island there is not much room for agriculture; which has however greatly declined since the period of the republic, when treaties were written on this interesting subject. N. lat. 62° 15' to 67° 15'. W. long. 10° to 23°.

ICELAND, or ISLAND CRYSTAL. See CRYSTAL OF ICELAND.

ICELAND, in Mythology, the son of Sleep, according to the fable, and brother of Morpheus, who is said to have the power of changing himself into a variety of forms; "varius imitantis formas formam, delude mensis imago." Ovid. Met. lib. ii. c. 630.

ICENI, in Ancient Geography, a British people, who were situated to the north of the Trinobantes, and inhabited that country, which is now divided into the counties of Suffolk, Norfolk, Cambridge, and Huntingdon. This nation is called by several different names by the Greek and Latin writers, as Sibnocy Pontici, Cemagnimia, and Cefar, &c. They do not seem to have made any opposition to the Romans at their first invasion under Caesar, but made their submission at the same time with several of the neighbouring states. (Cæs. Bell. Gal. l. v. c. 14.) At the next invasion in the reign of Claudius, the Iceni entered into a voluntary alliance with the Romans; but soon after, joining with some other British tribes in a revolt, they were defeated in a great battle by Otho, son of Scapula, the second Roman governor of Britain, A. D. 50, and reduced to a state of subjection. For some time after this they were treated with much favour and indulgence by the Romans, and even allowed to live under the immediate government of Praetorius, their own native sovereign. But after the death of that prince, the Iceni were so much enraged at some grievous insults which were offered to his widow and daughters, by the lust and avarice of certain powerful Romans, that they broke out into a second revolt, much more violent than the first. In this revolt they were commanded by the celebrated Boadicea, the brave and injured widow of their late king; and being joined by several other British tribes, they did many cruel injuries to the Romans and their allies. But being as length entirely defeated in battle, with prodigious slaughter, by Suetonius Paulinus, A. D. 61, they were reduced to a state of total and final subjection to the Roman government; and the Romans took great pains to keep them in this state of subjection, by building many strong forts, stations, and towns in their country. (Tacit. Annal. i. iv. c. 40. 41. 42.) The capital of the Iceni, which is called by the Roman writers Venta Icenorum, was situated at Caister, on the banks of the river Wintar, about three miles from Norwich, where some vestiges of its walls are still discernible. Several of the Roman stations in the country of the Iceni are mentioned in the fifth Iter of Antoninus; as Villa Faulum, Iceni, Camboriciurn, Durolipons, and Durombriva; i. e. St. Edmundbury, Ickborough, Chesterfield, Waltham, and Caister on the Nene. Some other places in the same country are mentioned in the ninth Iter, as Venta Icenorum, Sitomagus, and Comberetonium, i. e. Caister, Wulpit, and Stretoft. Two places on the sea-coast are mentioned in the Notitia Imperii, Branodunum and Garononum, i. e. Brancaster and Yarmouth, in which strong garrisons were kept by the Romans to protect the country from the depredations of the Saxon pirates. The territories of the Iceni made a part of the Roman province Britannia Prima. Henry's Hist. vol. i.

ICESIA, or island of the Mediterranean, in the Sicilian sea. Potomky.

ICH-DIEN, the motto of the arms of the prince of Wales, signifying in High Dutch, I serve.

Sir Henry Spelman judges it to be Saxon, &c then; the Saxon d, with a transferre stroke, being the same with th e; and signifying, I serve, or am a servant, as the ministers of the Saxon kings were called servus er benanes. See CROWNS of BRITISH PRINCE.

ICHNAE, in Ancient Geography, a town of Greece, in Macedonia, placed by Pliny on the sea-coast near the Aixus.—Also, a town of Asia, in Mysia, on the banks of the river Rhipicho, N. W. of Nicephorium. This town took part with the Romans when Cnossus was defeated by the Parniens.

ICHNEUMON, in Zoology, the trivial or specific name of a kind of weevil that inhabits Egypt, especially on the banks of the Nile, and which is confuted particularly useful in diminishing the number of that formidable creature the crocodile, by nauseating itself into the banks of the rivers or the fards, and destroying the eggs; so that it was not without reason that it was ranked by the Egyptians in the class of their deities. It is a fierce and very crafty animal, about the size of the cat, and is distinguished from the rest of
of the *biverra* tribe by having the great toes remote, and the tail, which is thick at the base, tapering gradually to the tip, which is tufted. The ichneumon is a great enemy to serpents, lizards, reptiles, insects, and other noxious animals, and is sometimes tamed by the Egyptians, and kept in their houses to destroy mice. They call it Pharaoh's rat, and the peasants frequently bring it young to market.

According to Sonnini, neither the same ichneumon, nor that of Pharaoh's rat, is now known in Egypt. The Arabic name of the ichneumon is "Nems"; and, without doubt, it was one of the sacred animals of ancient Egypt. Particular care was taken of it while alive, and honours were paid to it after its death. Funds were set apart for its support; it was fed, like cats, with bread soaked in milk, or with the fish of the Nile cut in pieces; and it was everywhere forbidden to kill it. With great dispositions to familiarity, says Sonnini, the ichneumon is not now domestic in Egypt. The inhabitants do not now rear them in their houses, nor do they even remember their having been so brought up by their progenitors. This was doubtless the natural antipathy to crocodiles, attributed to the ichneumon. If some ichneumons, he says, have been seen flying with fury at the little crocodiles that have been offered them, it must have been the effect of their appetite for all sorts of reptiles, and not, as many persons have supposed, that of a particular enmity, or of a law of nature, which specially directed them to forestall the multiplication of this amphibious species. It would at least, continues this writer, have been as reasonable to suppose, that nature created the ichneumon on purpose to prevent the too great propagation of poultry, which, in fact, they destroy in much greater proportion than they do crocodiles. Besides, in more than half the northern part of Egypt, that is, in the part comprehended between the Mediterranean sea and the town of Siout, they are very common, although there are here no crocodiles; while they are more scarce in Upper Egypt, where crocodiles are very numerous. The ichneumon is no where more multiplied than in Lower Egypt, which being better cultivated, more inhabited, more moist, and more shady, affords also a more abundant supply of prey and food; and yet crocodiles are there never seen. The antipathy to the crocodile, erroneously ascribed to the ichneumon, belongs to a species of tortoise of the Nile, who, as soon as the young crocodiles are hatched, and reach the river, attacks and devours them. This species of tortoise is only to be found in the upper parts of the Nile, to which crocodiles are confined. This tortoise is the "turtle" of the Egyptians and Nubiens, and, as Sonnini conceives, has a much better title than the ichneumon to the god of the ancient Egyptians, and the wonder of writers. Sonn *Trav. in Egypt. See Viverra.*

M. Sonnini mentions a beautiful species of ichneumon-fly, with a long and strong weapon at the extremity of the body, which sometimes enters the houses in Egypt; and which shines with the most lovely colours: its head is of a beautiful emerald-green; the corselet and belly are of a glittering purple line.

**Ichneumon.** See Schmickel Fly.

**Ichneumon.** In *Entomology,* a genus of the hymenopterous order. See Wasp-Ichneumon Fly.

**Ichnography.** In *Periplus,* the view of any thing cut off by a plane parallel to the horizon, just at the base or bottom of it.

The word is derived from the Greek *xiphe,* *xeirakos,* foot-step, and *rtei,* 

**Ichnography** is the same as that which is otherwise called the *plan,* *geometrical plan,* or *ground plot,* of any thing, and is opposed to orthography or elevation. See also *Scenography* and *Stereography.*

**Ichnography.** In *Architecture,* is a transverse section of a building, exhibiting the circumstance of the whole elevation of the several rooms and apartments in the given story; together with the thickness of the walls and partitions; the dimensions of the doors, windows, and chimneys; the projections of the columns and piers, with every thing visible in such a section.

The drawing or designing of this is properly the work of the master-architect, or surveyor; it being, indeed, the most difficult of any.

**Ichnography.** In *Fortification,* denotes the plan or representation of the length and breadth of a fortress; the distinct parts of which are marked out, either on the ground itself, or upon paper.

**Ichohlanis,** the grand seignior's pages, serving in the seraglio.

The word, according to some authors, is composed of the Turkish words, *ich,* or *ich,* which signifies *aevus,* and *godan,* page, in which the whole ichoglan is a page serving within the palace, or seraglio. Others derive it from the barbarous Greek *oikocen,* or *oikocen,* which was formed from the Latin *incus.* These two etymologies give nearly the same sense to ichoglan, taking *incus* for *domus incus.*

There are the children of Christians, and bred up in an austerity scarcely to be conceived. The sultan prefers them to officers more, or less capable, as they appear more or less capable, and devoted to his service; but it is to be observed, they are incapable of offices till forty years of age, unless they have some particular dispensation from the grand seignior. They are educated with a great deal of care in the seraglios of Peru, Adrianople, and Constantinople.

They are under the direction of a capa igna, who presides over their exercises, and treats them with great severity.

They are divided into four ovals, or chambers, where, according to their several talents or inclinations, they are instructed either in the languages, religion, or exercises of the body.

**Ichor,** *χιχφρ, signifying any humour or liquidity, properly denotes a thin, watery humour, like serum; but is sometimes also used for a thicker kind, flowing from ulcers called aloof fancies.

**Ichon,** in *Surgery,* signifies a thin, bloody, acrid discharge, which frequently takes place from unhealthy sores and wounds.

**Ichthyites,** in *Natural History,* is the name by which Dr. Grew denominated several fish-moulds, or imprints of fish preferred in the collection at Gresham college.

"Rarities," p. 256.

**Ichthyocola,** *Ichthymolla,* formed of *ichthys,* fish, and *cocula,* glae, popularly called *jinglefish,* or *fish-glas,* is a solid precious substance, prepared from a kind of theurgeon kind, caught in the rivers of Russia and Hungary. The beugea affords the best; but the sounds of all freswater fish yield, more or less, fine jinglefish; particularly the smaller sorts, found in prodigious quantities in the Caspian sea, and several hundred miles beyond Astaran, in the Wolga, Yaik, Don, and even as far as Siberia. It is well known that our lakes and rivers in North America are flocked with immense quantities of fish, said to be of the same species with those in Muscovy, and yielding the finest jinglefish. The production of jinglefish requires no artificial heat, neither is the matter dissolved for this purpose, as it has been generally imagined: for, as the continuity of its fibres would be destroyed by solution, the mass would become brittle in drying, and snap short atonder, which is always
ICH

always the case with glue, but never with ijnglafs. The latter, indeed, may be resolved into glass with boiling water, but its fibrous recombination would be found impracticable afterwards, and a fibrous texture is one of the most distinguishing characters of genuine ijnglafs. Ijnglafs is nothing more than a certain membraneous part of fishes, divided of their native mucosity, rolled and twisted into different forms, and dried in the open air. The sounds or air-bladders of fresh-water fish, in general, are preferred for this purpose; as being the most transparent, delicate, flexible substances. They constitute the finest sorts of ijnglafs; those called book and ordinary staple are made of the intestines, and probably the peritonemis, of the fish. The sounds, which yield the finer ijnglafs, consist of parallel fibres, and are easily rent longitudinally; but the ordinary sorts are found comprised of double membranes, whose fibres cross each other obliquely, resembling the coats of a bladder. Ijnglafs receives its different shapes in the following manner: the parts of which it is composed, particularly the book, are taken from the fish while sweet and fresh, slit open, washed from their slimy fords, divided of every thin membrane which envelopes the sound, and then exposed to sniff a little in the air. In this state they are formed into rolls about the thickness of a finger, and in length according to the intended size of the flask; a thin membrane is generally selected for the centre of the roll, round which the rest are folded alternately, and about half an inch of each extremity of the roll is turned inwards. Having thus settled the proper dimensions, the two ends of what is called the short staple are pinned together with a small wooden peg; the middle of the roll is then pressed a little downwards, which gives it the resemblance of a heart, and thus it is laid on boards, or hung up in the air to dry. The sounds, which compose the long staple, are larger than the former; but the operator lengthens this roll at pleasure, by interfolding the ends of one or more pieces of the sound with each other. The extremities are fastened with a peg like the former; but the middle part of the roll is bent more considerably downwards; and, in order to preserve the shape of the three obtuse angles thus formed, a piece of round stick is fastened in each angle with small wooden pegs, in the same manner as the ends. In this state it is permitted to dry long enough, to retain its form, when the pegs and sticks are taken out, and the drying completed. Lastly, the pieces of ijnglafs are joined together in rows, by running pack-thread through the peg-holes, for the convenience of package and exportation.

The membranes of the book fort being thick and refractory, will not admit the fame formation; and, therefore, the pieces, after their sides are folded inwardly, are bent in the centre, in such manner, that the opposite sides resemble the cover of a book, whence its name; a peg, run across the middle, fastens the sides together, and thus it is dried like the former. The cake ijnglafs is formed of the bits and fragments of the staple sorts, put into a flat metallic pan, with a very little water, and heated just enough to make the parts cohere like a pan-cake when it is dried: but this is of little value. Ijnglafs is best made in the summer, as frost gives it a disagreeable colour, deprives it of its weight, and impairs its gelatinous principle.

The sounds of cod and ling bear a general likeness to those of theurgeon kind of Linnaeus, and are used for the same purpose. The Newfoundland and Iceland fisheries open the fish as soon as taken, and throw the back-bones, with the sounds annexed, in a heap; but previously to purification, the sounds are cut out, washed from their slime, and salted for use. In cutting out the sounds, the parts between the ribs are left behind, which are much the best; the Iceland fishermen are so fond of this, that they beat the bones upon a block with a thick fik, till the pockets as they term them, come out easily, and thus prefer the found entire. If the sounds have been cured with salt, that must be dissolved by steeping them in water, before they are prepared for ijnglafs. The fresh found must then be laid on a block of wood, whose surface is a little elliptical, to the end of which a small hair brush is nailed, and with a saw-kife the membranes on each side of the found must be scraped off. The knife is rubbed upon the brush occasionally, to clear its teeth; the pockets are cut open with scissors, and perfectly cleansed of the mucous matter with a coarse cloth; the sounds are afterwards washed a few minutes in lime-water, in order to absorb their oily principle; and lily, in clear water. They are then laid upon nets to dry in the air; but, if intended to resemble foreign ijnglafs, the sounds of code will only admit of that called book; but those of the staple differ. The thicker the founds are, the better the ijnglafs, excepting its colour; but that is immaterial to the brewer, who is its chief consumer. See Mr. Jackson's Account of the Discovery of the Manufacture of Ijnglafs, in Phil. Trans. vol. xiii. part i. p. 1. &c.

Ichthyocolla, or ijnglafs, is one of the purest and finest of the animal glues, of no particular smell or taste. Beet into threads, it dissolves pretty readily in boiling water or milk, and forms a gelatinous substance, which yields a mild mucin, and proves useful, medicinally, in some disorders arising from a sharpness and colliquation of the humours. A solution of it in water, curiously spread, whilst hot, upon silk, affords an elegant sticking-plaifer for injury injuries of the skin, not easily separable from the part by water, and scarcely inferior to the more compounded one used under the name of the ladies black sticking-plaifer, in which different balsams and resins are joined to the ichthyocolla. See Emplastrum adhefsum. Lewis's Mat. Med.

Ijnglafs is used in miniature painting, in the same manner as the gum Arabic of Senegal, for rendering water a proper vehicle, by giving it a due viscidification; spreading and binding the pigments of an earthy texture. But the greatest quantities of it are consumed by brewers, wine-coopers, &c. for fining their liquors. See FIXING.

A size may be made of ijnglafs, by boiling half an ounce of the beaten ijnglafs in a pint and half of water, till the whole be dissolved, and then straining the hot fluid through a linen rag. The size may be reduced by taking half the above quantity, and adding to it an equal measure of hot water.

A very valuable glue is to be made of this drug. See GLUE.

It is valuable, in that it will keep aloof, and is a very proper form to keep ijnglafs in, for readinics for the wine-cooper's use; besides this it serves aloof very elegantly for the taking off the impreffions of medals, coins, &c. See MEDAL.

Ichthyocolla Piis, in Ichthyology, the name of a large fish, of theurgeon or acipenser kind; from which, as also from the hupo Germanorum, the drug called ijnglafs or ichthyocolla is made. It is a fish of very great size, and is cartilaginous, having no bones or scales; its head is large and thick, and its mouth stands very forward; the upper jaw has four feily apophyfes hanging from it; its eyes are small; its flanks are very well tailed, but glutinous; it is of a yellowish colour, and its tail is large and forked. See Beluga-fons.
ICHTHYODONTES, in *Natural History*, is a name by which some authors describe the glosiapetra, or fossil teeth of fish.

ICHTHYOLITE, *Ichthyolithus*, in *Natural History*, a name given to the fossil remains of fishes, and also to the impressions of these animals or their skeletons in stone. Some authors, however, have applied that term to such specimens only as exhibit the fish itself, either petrified or in the flat of a mammy; while the name of Typholite has been proposed for such fomy substancses as exhibit the mere impression of those animals. The number of species of which the fossil remains have been described by naturalists is comparatively small; nor can this be a matter of surmise if we consider the extreme tenderness of the substance, and the corruptible nature of most fishes, together with the many circumstances unfavorable to petrification under which they are generally found after their death. Even those few that, by being accidentally enveloped in mud and soft clayey sediment at the bottom of the water, are preserved from falling into immediate dissolution, or from becoming the food of the inhabitants of the waters, generally leave but faint traces of their original form. Sometimes, however, we see their external appearance completely preserved, as in those of *Vetella* in the Veronese territory, and those in the bituminous marle-flat of Oeningen; or they appear as solitary mummies, inclosed as it were in a coffin of a grey marle, in which floats the Arctic trout (*Salmo arcticus*) is frequently seen, particularly at Zuczerkop, on the weal coast of Greenland.

Where petrified fishes or their impressions occur in considerable number, we may always be certain that they perished by some sudden revolution or catastrophe, by which they were overwhelmed in heaps on the very spots where geological history they now contribute to elucidate. The most extensive depository of fossil remains of fishes is that of *Monte Bolca*, or rather of *Vetella Nova*, in the Veronese territory. *Vetella Nova* is a district separated from Monte Bolca by the river Scarrato Major, which receives the rivulets that descend from the mountains on both its sides. Within the boundaries of this place, one thousand paces from the village Bolca, and about 242 paces lower than the summit of the mountain of that name, we find the fish-quarry called *Lafrara*, being a hill whose height above the level of the sea is about 38 French toises. The rock which predominates almost in the whole of the district of Bolca and Vetella, is basalt, both mafive and prismatic. The three places in which the latter appears particularly characteristic are the Valle dei Stanghelli, mount San G. Harione, and the upper part of Monte Bolca, called La Purga di Bolca. The basaltic columns are in general perpendicular to the axis of the mountain; but those of San Giovanni Harione are rather inclined to the horizontal line, and appear to have been formed, out of their original position. Besides basalt there occur other rocks in these mountains that have the appearance of being volcanic productions; such as an ash-grey conglomerate, red cellular flons likecora, and a violet coloured ferrulized earth, not unlike the puzzolana of true volcanoes. Some of these masses are full of nodules of fibrous zeolite and calcareous spar; others contain fragments of feld spar and quartz, while still others exhibit an uniform solid mass without any imbedded substancess. Only the firit mentioned of these rocks have the appearance of productions of volcanoes; the others obviously belong to the porphyritic formation, and some of the last mentioned are hornstone. But of all the rocks just noticed, none are to be seen in the immediate neighbourhood of the immense quarries where the fishes are found. Thefe consist chiefly of a more or less ffill marle diposed in layers which, observing exactly the same succeflion in the different adjoining hills, appear to prove that these formerly constituted a continued ridge. One of the hills consists principally of a whitish, porous, friable tuff, resembling common cement; it is made up of particles of lime and sand, containing a vast number of fossil shells, particularly of *Murex alca* and Turbo crisilium, natives of the Mediterranean, and here converted into a white marble; also of Turbo unguinatus, marigatun, and teres or Linnaeus. In some places the tuff becomes much harder; it plates into a kind of common limestone, and is found to contain mammalians, and lida of shells belonging to the above species.

The *Lafrara*, or hill where the fishes are found in abundance, has for its uppermost stratum a kind of mould mixed with the detritus of basalt and other rocks. The interior conffits of two distinct kinds of strata; the one called Zengio is a hard marle-like limestone, traversed by veins of calcareous spar: it is not divisible into thin layers, and seldom contains any petrifactions. The other strata, called Lafrara, consist of a schafiole marle, divisible into very thin layers, giving out a foetid odour when rubbed. The colour of this mafs is whitish, yellowish, or bluish-grey. It varies with regard to hardness, but is in general easily scraped by the knife. In this alone the remains of fishes are found, which are sometimes seen accompanied by parts of marine algae; at other times the sea-weeds occur separate.

The fishes in question are mostly sea-fish, but there are also foame of fresh water found among them. The originals of many, if we can trust the naturalists that appear to have examined them with great care, live now in regions most remote from each other; among them are the natives of Europe, the Indian ocean, Africa, and North and South America. The remains of the fishes thus imbedded are all of a dark-brown colour, and therefore appear very distinctly on the light ground of the stone; they lie flat among the lamine, their profile and their several parts, little, if at all, disfigured from their natural shape and dimensions, except that in some cases the stone inclosing them seems to have suffered some little disturbance after their inclusion, by which they are found at times somewhat fractured, and the parts a little disjoined. Their whole form is well defined, but the harder parts, such as the head, fins, spine, with the bones that branch from it on either side, and indeed all the bones in general, as well as in some the fishes, are remarkably well expressed. The dark-brown matter composing these fishes remains distinct, and may be picked off from the stone; it projects in proportion to the thickness of each part in its natural state; it is hard, brittle, and rather glossy through its substancess, except in some of the larger bones, such as the joints of the vertebrae, which, though of this appearance externally, are found, when broken, to confit internally of laminar calcareous spar. On cleaving the matrix the forms are found equally announced on each of the opposite sides, the prominences on one side being exactly answered by corresponding hollows on the other.

We cannot be too careful in determining the species of the prototyperes of fossil remains; in cases, therefore, where difficulties arise with regard to their diagnoses, it is much more advisable to abstain from pronouncing with confidence than to mislead the geologist by inaccurate determination. This is more particularly the case with fossil fishes; and it is owing to the difficulties which attend their diagnosis, that the opinions of different naturalists respecting the species, or even the genus to which specimens are to be referred, have been often too very contradictory. Upon the whole it may be said, that those of the Veronese territory are determined with greater care and exactness: and it is much to be wished that the authors
author of the "Ictiologist Verone", which contains the descriptions and figures of no more than sixteen species, all of them preferred in the Bozza collection, might have been encouraged to proceed with this highly splendid and instructive work. The just mentioned sixteen species are,
1. The shark (Squalus carcharias, Linn.). It has all the characters of this species, but its length is only 26 inches.
2. The winged chetodon (Chetodon pinnatus, Linn.) first described and figured by Scheuchzer, under the name of "Pecius fossilis elegans," and conjectured by him to be the Brazilian Guaperu described by Marcegr. 3. The trumpet fish (Fistularia chinenes, Linn.). 4. The sea-needle (Ejox Brofijfenfbl, continued by Bloch as a variety of E. elene.
5. The swimming sea-horse (Pegusus natans, Linn.), unique, in the Bozza collection.
6. Uranoscopus reffrum. It was first described by Bozza as the unicorn fish (Balistg monoceros) of Cateby: but a more close examination renders it highly probable that it is an unknown or loth species of star-gazer, to which, on account of the long ferrated dorsal fin, the above specific name has been given. 7. The bat chetodon (Chetodon volffolfi, Bloch.). 8. The Portoveo, a fish not before described, belonging to the order of Leucaenues, and in all probability to the genus Kurtus, established by Bloch. It is here called Kurtus volffolfi; it approaches very near to Arcarauna of Willughby, and the Spinitheus of Rayich. 9. The ace fish (Chatodon arcatus, Bloch), unique in Bozza's cabinet. 10. Terodon hanewu (B.); a small species, which, in its present form, has already been mistaken by some for the impression of elliptic leaves, by others for tadpoles. Only a few specimens have been found in the Verone fish. The bishop of Winchester is mentioned in the "Ictiologistia," as having acquired at Verona a much larger and better preserved specimen than the one figured in that work. It is not found in the common grey-coloured layers of Bolca, but in the brown and ash-grey variety of marl-flate of that hill. 11. The globe-fish (Terodon bifidus, Linn.). The foill remains of very small specimens of this fish are found only in the whitish and yellow coloured layers of marl-flate in the Latruna.
12. A species of ray, denominated Raja murica by Marcegr, which name is here retained. The Portuguese, on account of its shape resembling that of a medical instrument, call it "Valet," neither American nor Bloch make mention of it; there can, however, be no doubt that it belonged to that tribe of rays which inhabit the Arabian seas, and is comprehended by Forskall under the name of Raja fepben. 13. Chetodon mefolucus. The prototype likewise described by Forskall as a native of the Arabian seas, to which locality Bloch has added that of Japan; but Gmelin, considering both as distinct, calls that of Forskall Chetodon mefolucus, distinguishing the Japanese fish by the specific name of mefolucus. 14. The argus (Chetodon argus, Linn.). Forskall has erroneously described this ichtyology under the name of Chetodon faber. 15. Gobius barbatus, a new species, approaching the G. occtatus of Broussonet, under which name this fofill fish has been before erroneously described by Bozza. 16. Gobius Feronenfis. This has been described by Forskall and Bozza as the G. frigatus of Broussonet; posterior observations have, however, proved it to be distinct from the last mentioned species.

To the species just enumerated, we subjoin the following sytematic list of Bofka ichtiolophics, in the famous collection of Signor Vincenzo Bozza, which, in 1791, was united with that of the marquis Gazzola, and is now preferred in the Museum of Natural History of Paris: but whether they are as well determined as those in the "Ictiologistia Verone."
ICHTHYOLITE.

fes, was raised by the action of subterraneous fire. Notwithstanding the plausible reasons that have been given by those naturalists in favour of the volcanic origin of the Bolca fishes, there are several very respectable writers, and among them the author of "Ictioloogia Veronese," who, after a minute examination into the nature of those hills, and the circumstances under which the fossils remain occur in them, have not hesitated to pronounce them of Neptunian origin. Their observations lead them to suppose, that the district of Veletana and Bolca is the result of a widely extended deluge, which collected the fishes, shells, and plants of distant parts of the globe into one common sea; and that successive partial inundations, together with the occasional ignition of the inflammable substances previously deposited, produced the volcanic appearance of the masses of rocks above those strata which contain the remains of fishes, and which are totally destitute of the characteristics of volcanic productions.

The ideas which Mr. Graydon has offered on this subject, in the Transactions of the Royal Irish Academy are, in substance, as follows. The very perfect preservation of the living form observable in the specimens from Veletana and Bolca, appears to prove that the fishes could not have been long dead, before they were enveloped by the calcareous marl, which must have been submersed in the water, and, on subfiding, have caught and enclosed the fish which probably derived their death from this very cause. The bodies of these animals did not undergo any simultaneous putrefaction, but their oily and other soft parts were absorbed by the enclosing mass. This fleshy substance being for the greatest part calcareous, Mr. Graydon supposes that a vast body of it, previously calcined or reduced into quick lime by the agency of subterraneous fire, again passed into the state of flaked lime, as soon as it came into contact with the waters, from which subfiding it graduaily and successively concreted at the bottom, and assumed the structure of a siliceous mass, which becoming afterwards impregnated with the oily parts of the fish, acquired the fettid smell which it is still found to emit on being scraped with a harder substance. It is highly probable to the fame author, that these masses, in their original position, maull have formed part of a continued and horizontal stratum of very considerable extent, of which the quarries of Bolca are evidently to be considered as no more than portions or fragments, now completely disjoined from all connection with their native bed. This separation must have happened after the consolidation of the original stratum; for it could not have taken place in the yet soft and yielding substance, without producing a considerable disturbance both in the laminar structure of the mafs, and in the forms of the fishes. It would therefore seem, that at some subsequent period, the whole of the stratum was violently broken up, and immense fragments of it heaved from their natural situation, and dispersed here and there as in the instance before us. The author considers the eruptive force of subterraneous fire fully adequate to producing these effects, though he allowed, that it must have operated in the present case with a force much exceeding whatever has been experienced in the known history of volcanoes.

In whatever manner we explain the phenomenon of the Bolca fishes, it will always be found extremely difficult to account for the collection, in one spot, of so many fishes from various parts of the globe most remote from each other, and among them some which live in fresh water. Indeed, this difficulty appears so great, that we are almost inclined to suspect the accuracy of the observations made to ascertain the originals of these fossil fishes, and that many of them should be considered rather as approaching to, than as being the same with, the species to which they are referred by authors.

We subjoin, from Patrin's account, what relates to the ichthyolites of the gypsum quarries of Aix, in Provence, which are not less remarkable than those of Veletana and of Oeningen. The strata that are open to view in descending by 110 steps, into the interior of the mountain at Aix, are few in number: 1. A kind of marle-flate, called argile feuillatée by the miners: it is of a brownish-yellow colour, and when immersed in water, separates into very delicate layers. 2. The white stone (pierre blanche), a chalk like marle, which, when dissolved in acids, leaves a considerable quantity of a brownish-grey clay. 3. Hard clay (argile dure). 4. The black stone (pierre noire), a variety of marle-flate, perfectly like that of N 1, but full of rhomboïdal fellent crystals. 5. The stratum containing the impressions of fishes: it is a siliceous rock of a yellowish-grey colour, soft, rather foiling, divisible into thin layers, and giving out a slightly bituminous smell when scratched. 6. Bed of gypsum; and 7. A stratum of what is called by the quarriers pierre fraude, a substance which much resembles that of N 5; both are of a greyish-white colour, have a nearly conchoidal fracture, adhere but little to the tongue, and feel cold; they both dissolve with difficulty, but leave a great proportion of clay. Lower down the same succession of strata is continued, but no impressions of fishes are found in any of them. The fishes buried in the stratum, below the gypsum, are, according to Darluc, the red furmulet (Mullus laskcatos, L.); the lunate girt head (Sparus aurata, L.); sea-wolves; the whiting (Gadus merlangus, L.); a gurnard (trigla), which resembles, but fully appears to be distinct from, the Trigla cataphracta, a native of the Mediterranean, on the coast of Provence. All these fishes lie flat on their sides, as a proof that they perished on the very spot they now occupy. Patrin is of opinion that these fishes have been inofficd by the sulphurous vapours which, by their combination with lime, have formed the upper stratum of gypsum; that, however, at the time when similar emanations formed the older strata of gypsum, the waters of the ocean still covered the high land which encompassed the tract so that the fishes were enabled to escape, and that none were suffocated but at a period when, by the diminution of the sea, this same tract of country was become surrounded by coasts that checked the flight of the fisbes.

A great number of impressions of fishes are found in the quarries of Oeningen on the right bank of the Rhone. The strata observed there below the vegetable mould, which is white and clayey, are, 1. A stratum, only one inch thick, of friable and fine-grained sand-flate, composed of transparent sharp-edged grains of quartz, cemented by a mixture of clay and lime. 2. A layer of a compact clay, four inches in thickness, effervescing with acids. 3. A layer, twenty-six inches thick, of a flatly clay mixed with lime, and some bitumen. 4. A layer of one foot in thickness, of a yellowish-grey calcareous ichitus, intermixed with minute layers of clay, of a dark-grey colour, and containing a small portion of bitumen. 5. A bed, eight feet thick, composed of clay flatly, divisible into fine laminæ, and alternating with flat clay, which has no flaty structure. 6. The flaty rock which contains the impressions of fishes, and which is called bonne pierre by the quarriers. It is composed of strata, which together form a thickness of twelve feet, and each of them is separated from the upper and lower by same earth, impregnated with bitumen. It is easily divisible into laminae, on which are discovered the impressions of the fish. This flaty
flinty stone is pretty soft, although it is as sonorous as a brick: it adheres to the tongue, and when dissolved in acids, leaves a considerable proportion of clay. Beneath these layers, of 12 feet in thickness, there are four inches of a flinty mafic, which, however, contains no impregnations. Dr. Lavater possessed a rich collection of ichthyolithes of Oeningen, among which he has recognized the following species: the fish lamprey (*Petromyzon fluviatilis*); the common eel (*Anguilla anguilla*); the bull-head (*Cottus gobio*); the brill (*Pleuronectes rubens*); the scad (*Scadus scadus*); the milled gurnard (*Trigla cataphracta*); the lucerna-gurnard (*T. lucerna*); the thorny leech (*Colostis tenuia*); the leach (*C. barbula*); the trout (*Salmo fario*); the pike (*Esox lucius*); the herring (*Clupea harengus*); the sand (*C. albius*); the bream (*Cyprinus brama*); the minnow (*C. phoxinus*); the doble (*C. gobio*); the crucian (*C. carassius*); the bordsiere (*C. blica*); the dotted carp (*C. pimпаtatus*); the bittling (*C. aramur*); *Cyprinus fyllia*; the round-tailed chub (*C. cephalus*); the loach (*C. rutilus*); the gudgeon carp (*C. rubrofuscus*); the bleak (*C. alburnus*); the dace (*C. leuciscus*); the tench (*C. tinca*); the nase (*C. nase*); the common (*C. gaster*); the gudgeon (*C. gobio*).

The Hebran ichthyolithes, particularly those found at Rieggeldorf, in bituminous marl-flate, are more particularly remarkable on account of the dilated forms exhibited by the fishes, with whose impregnations it abounds. This circumstance, and the great quantity of copper found in that rock, have induced a belief that the death of these fishes was occasioned by a sudden immersion of the waters with a copious solution. It is worth observing that the more the impregnations of fish abound in any particular part of the strata of marl-flate, the richer there are found to be in copper ores. Mr. Reid has given an account of the succession of the fish strata at Rieggeldorf, which are the following: 1. Ferruginous clayey mud, from one to two fathoms. 2. Greyish-white limetone from 6—8 fathoms. 3. Bluish clay, with imbedded fragments of felsitic crystals 8—10 fathoms. 4. Blueish limetone, called *Rauel-nest*; 8—9 fathoms. 5. Grey compact gypsum, traversed by ferruginous loam; 7—8 fathoms. 6. Black and grey flintkite; 1—1½ fathom. 7. Sand, sometimes loamy, sometimes cemented; 1½ fathom. 8. A kind of limetone called Zechstein, of a greyish-brown colour, and soft above towards the sand, but blunter and more compact below; 3½—4 fathoms. 9. A black clay stratum, containing pyrites, and forming the roof of the bituminous marl-flate; 18—20 inches. 10. Black cuperous bituminous marl-flate; 3—8 inches. This is the principal depositary of the ichthyolithes. 11. Gneiss-like greyish-white rock, consisting of small rounded quartz pebbles, and sometimes of fragments of jasper and mica, cemented by indurated clay; 6—18 fathoms. 12. Old red sand-flite, or the dead rock, being the fundamental rock of these flinty strata. From the above it appears that the greater part of the impregnations of fishes, plants, and other subjects (among which Mr. Reid supposed to have found the skeleton of the hand of a child, but which Blumenbach considered as having belonged to a species of ape), are found in the depth of upwards of forty fathoms. Most of the fishes occurring there are carp, trout, pikes, and other species similar to them, which are rare and then accompanied by fishes supposed to be marine. In general the impregnations are not indiscriminately mixed, as is the case in other places where ichthyolithes occur, but each species is found in distinct theals.

The opinion which Mr. Patrin, a celebrated volcanist, entertained respecting the origin of those vast depositories of the fossil remains of fishes, should not be left unnoticed in this place. According to him, all circumstances appear to prove that these fishes lived in bays and gulfs, at the entrance of which volcanoes were situated either in the points that formed the mouth, or in some island, similar to the volcanic island of Ischia, at the entrance of the gulf of Naples. Under such circumstances, the sulphureous and other deleterious vapours which were diffigerated from the submarine bases of the volcano, at the time of an eruption, must have suffocated the fishes in the gulf, which were prevented from escaping through its entrance where those vapours were most abundant. The dead bodies of these fishes, therefore, floated on the surface of the water in the gulf, till, enveloped by those showers of ashes, so abundant at the beginning and termination of the eruptions, their specific gravity became greater than that of the water; and they sunk to the bottom, where they were ultimately buried under a stratum formed by the ashes or other substances ejected from the volcanoes. In cafes where the gulf had but little depth, at the same time that the volcanic eruptions were abundant, the fishes were enveloped at once, and formed a single bed, such as may be seen in some places where ichthyolithes occur on the shore. Under other circumstances the eruptions may be supposed to have been repeated for several times, in which case several beds containing bodies of fishes were deposited in succession, and separated from each other by layers detritus of such remains, but nevertheless owing their origin to the same eruption that caused the death of the fishes contained in the others.

These events, Mr. Patrin continues, could take place only at a period when the continents were already sufficiently railed or emerged to give existence to gulfs and bays, whose fides, elevated above the surface of the water, served as a barrier to the fishes; since it is evident that these, had the present shores been filled covered by the sea, would have escaped in all directions from the effects of the suffocating vapours. This hypothesis, the same author thinks, is supported by the following circumstances: 1. It is only in a few places that we find beds filled with fossil fishes; and the appearance of such places bespeaks the former existence of volcanoes in them. 2. The bodies of these fishes are in perfect preservation, dispensed with great regularity, often even united in tribes; which proves their having been suddenly destroyed and buried under the stratum which now covers them. 3. They are not unfrequently seen in variously contorted shapes; as a proof that their death was attended with convulsive motions. 4. These fossil remains of fishes are found only in strata of very recent origin; whereas, had they been preferred under ordinary circumstances, like shells and zoophytes, they would be found in a variety of localities, and in strata of much less recent formation than those in which they now occur.

I C H T H Y O L O G I S T S, authors who have written concerning fishes. The authors who have left us treatises on this subject are very numerous; and are ranged by Aretedi into their several proper classes, with great care and candour. The fytematical ichthyologists are Aristotle, Pliny, Isidore, Albertus Magnus, Gaius, the interpreter of Aristotle, Marshall, Wotton, Bellonius, Rondeletius, Salvian, Geyner, Aldrovand, Johnlin, Charlton, Willughby, Ray, Aretedi, and Linnaeus.

The ichthyologists who have written of the fishes only of some particular places, are these: Ovid, of the fishes of the Euxine; Oppian, of those of the Adriatic; Annius, of those of the Mediterrenean; Mangolt, of those of the Podane lake; Paulus Jovius, of those of the Tyrrhenian sea; Bened.
ICH

Jovius, of those of the lake Larius; Petrus Gillius, of those of the Malacian sea; Figulus, of those of the Mofelle; Salvian, of those of the Tyrhene sea; Schwenkfeld, of those of Sileia; Schonefeldt, of those of Hamburg; Margrave, of the Brazilian fishes; Ruyfch, of those of Amboyna; and Francis Valentine, of those of the same place. Of these authors, Ovid, Anuarius, Oppian, and Bened. Jovius, wrote in verse, the rest in prose.

The ichthyologists, who have copied all they have written from the works of other writers, and therefore least deserve the name, are the following: Pliny, Elianus, Atheneus, Tidore, the author of the "Libri De Natura Rerum," Albertus Magnus, Johannes Cuba, Marschall, Gefner in great part, Aldrovand in great part, Johnston, Charlton, and perhaps some others.

In regard to method, some have written of fishes without any method at all; some have treated of them in the alphabetical order of their names, and some have followed a method more or less perfect throughout their works.

Those ichthyologists who have attended to no method at all, are Ovidus, Elianus, Atheneusus, Anuarius, Hildesgarde, De Pinguis, Paulus, and Bened. Jovius, Figulus, Salvian in his "History of the Roman Fishes," and Ruyfch.

Those who have written alphabetically, are Cuba, Marschall, Salvian in his "Tabula Piscatoria," Gefner, Schonefeldt, Johnston.

Among the authors who have used some sort of method, those come first who have treated of fishes according to the places where they are usually caught. Of these are Oppianus, Rondeletius, Aldrovandus, Johnston, and Charlton.

Those who have treated of fishes, according to the general division of them into cetaceous, spinole, and cartilaginous, are Aritotleus, who was author of the method, Wootton, Willughby, Ray; the last two authors have added to this the numbering the rays of the fins on the back, which is one step towards the Artedean method.

The principal and best authors in this study, and who have reformed and amended it, are Aritotleus, Belonius, Rondeletius, Salvian, Gefner, Willughby, and Ray. To these are to be added such as have described only new or particular fishes, who have merited greatly of the world by the new lights they have thrown in upon this part of natural history. These are Paulus Jovius, Petrus Gillius, Schonefeldt, Sibbald. Marighi, Henbenkreit, and our countryman Mark Catesby: all the rest, except Pliny, Atheneusus, Aldrovand, and Johnston, are of no use or value. Willughby is allowed by Artedi to be by far the best author on the subject; but the world will now give that character to Artedi himself. Artedi, De Script. Ichthyol.

ICHTHYOLOGY, in Natural History, the science of fishes. See PISCES.

ICHTHYOMANTIA, 15χονοματις, in Antiquity, a species of divination by means of the entrails of fishes.

ICHTHYOMORPHUS, in Natural History, is the name which Aldrovandus gave to the flattened ossile fish, found at Ileb in Germany. Similar fishes are found at Olterode in Brunswick, near Eislebe, in Mansfleld county, and other places in Germany. Jones’s Phys. Disq. p. 410.

ICHTHYOPHAGI, 15χονοφαγ/, compounded of oχονο, fish, and φαγ/, to eat, fish-eaters, a name given to a people, or rather to several different people, who lived wholly on fish.

The Ichthyophagi, spoken of by Ptolemy, are placed towards China. Agatharchides calls all the inhabitants between Carmania and Gedrofia by the name of Ichthyophagi. Paufanias places them near the Red sea, and Pliny peoples several isles with them to the exit of Arabia Felix.

From the accounts given us of the Ichthyophagi by Herodotus, Strabo, Solinus, Plutarch, &c. it appears, indeed, that they had cattle, but that they made no use of them, excepting, as they say, to feed their fish. They made their houses of large fish-bones, the ribs of whales serving them for their beams. The jaws of these animals served for doors; and the mortars wherein they pounded their fish, and baked it in the sun, were nothing else but their vextures.

ICHTHYOPHTHALMITE; Zoolite of Hellefia, Rinnmann; Ichthyophthalmit, d'Andrada; Fischauge-ftein, Wern.; Appyphylite, Hauy.

A rare mineral substance, which, on account of one of its chemical characters, has been considered as zolite by some mineralogists; while one of its external characters, viz. the pearly lustre, has induced others to clas it with adularia-feldspar. A closer examination has proved this mineral to constitute a distinct species.

D'Andrada has given the above appellation to this mineral, on account of its exhibiting a similar reflection to that of the adularia or moon-stone, sometimes called adl de paifon, of which the German fchauge-ftein is a traslation. Hauy’s name is derived from the property this substance has of exfoliating under certain circumstances.

The colour of the ichthyophthalmite is white, generally slightly tinged with red, grey, and blue, telled with yellow and green.

It occurs massive and crystallized. The primitive form of its crysials is, according to Hauy, a four-sided prism with rectanguiar base. The simplest of the secondary forms is the primitive paralleloipedon, with its eight fold angles intercepted each by a triangular plane; the Appyphylite epitone of Hauy.

Another, but very complicated, variety of 48 planes, determined from an incomplete crysial of only ten remaining planes, is characterized and figured, (Journ. des Min. vol. 23, 5. f. 3, 4.) by Hauy, who calls it Appyphylite far-compact.

None of the modifications of the crysials have hitherto been found in a complete state; most frequently they occur as thick tables, grown together in all directions, or intersecting each other, and resembling at first sight a variety of tabular barytes. They are splendent, and generally exhibit more or less the lustre of mother-of-pearl; in the manner of a variety of flibite.

The fracture, parallel to two of the planes of the primitive parallelopedon, is foliated, with splendent often iridescent surface; cross-fracture uneven with vitreous lustre.

In small fragments it is generally perfectly transparent, but often rendered translucent only, and even nearly opaque, by a cloudy or milky suffusion. Refraction fimple.

It is easily fractureable. Its hardness is nearly that of flour spar. A small fragment, when rubbed on a hard body, according to Hauy, separates into thin leaves; this property is, however, not observable in all specimens.

Its specific gravity, according to Vauquelin and Fouriry, is 2.467.

Before the blow-pipe the ichthyophthalmite becomes at first opaque, and melts, without difficulty, into a very white opaque globule. With nitric or muriatic acid it becomes softened, and forms a jelly, like zolite. This property appears to be owing to the presence of water, which facilitates the action of the acids on thoee consatuent parts of the substance with which they can unite.

Analys
This substance, therefore, differs essentially from zeolite, in not containing the least portion of alumine; the variety from Helelta has, indeed, afforded a small quantity to Mr. Rinnmm, but this appears to be accidental. A small quantity of oxyz of iron found in this substance may likewise be considered as accidental.

This mineral is found in the iron-mines of Uto, in Sweden, a province of Sweden.

ICHTHYOSIS, in Medicine, fish-skin diseas, from ichthys, a fish, a denomination appropriately used by Dr. Willan to denote "a permanently harsh, dry, scaly, and in some cafes, almost hoary texture of the integuments of the body, unconnected with internal disorder," bearing a considerable resemblance to the skin of the scaly fishes.

This rare species of cutaneous disease constitutes the fourth genus of the second Order, (or scaly eruptions,) in Dr. Willan's arrangement, and is distinguished from the other eruptions, included in the same Order, the Lepra and Psoriasis, in being generally diffused over the limb affected, and in the permanency of its scales; for in the other scaly eruptions alluded to, the diffusion is partial, or in distinct patches, and the scales are deciduous. See Lepra and Psoriasis.

The arrangement and distribution of the scales in ichthyosis are, indeed, peculiar. Above and below the olecranon on the arm, and in a similar situation with respect to the patella on the thigh and leg, they are small, rounded, prominent, or papillary, and of a black colour. Some of the scaly papille have a short narrow neck, and broad irregular tops. On some parts of the extremities, and on the trunk of the body, the scales are flat and large, often placed like tiles, or in the same order as scales on the back of a fish; but in a few cafes they have appeared separate, being interfused by whitish furrows. There is usually in this complaint a dryness and roughness of the soles of the feet; sometimes a thickened and britten plate of the skin in the palms of the hands, with large painful fissures, and on the face an appearance of scurf rather than of scales. The inner part of the wrists, the hams, the inside of the elbows, the furrow along the spine, the inner and upper parts of the thighs, are perhaps the only portions of the skin always exempt from scalliness. Patients affected with ichthyosis are occasionally much harassed with inflamed pustules, or with large painful blisters on different parts of the body; it is also remarkable, that they never seem to have the leat perspiration or moisture of the skin.

The causes of ichthyosis seem to be altogether unknown. The disease did not, in any cafe witnessed by Dr. Willan, appear to have been transmitted hereditarily; nor was more than one child from the same parents affected with it. In several instances it was said to have been concomit, and in others to have occurred two or three months after birth; in one case it appeared soon after the small-pox, at the age of two years, and had continued fix or seven years, without alteration. A state of skin, similar to that in ichthyosis, takes place partially under a variety of circumstances. It occurs on the limbs of persons who, from long continued ill health, or a weak constitution, are much emaciated, and have little perspiration. When ulcerous ulcers on the lower extremities are at length healed, the common integuments are not replaced in their usual order; instead of cuticle, the legs are covered with thick, dry, thinning scales, variously disposed. In cases of anasarca, likewise, the skin becomes scaly, rigid, and inelastic. This rugged coating prevents for a time any farther enlargement of the limbs; but the effused lymph, by its gradually increasing pressure, at last overcomes the resistance, and is discharged through innumerable crevices.

According to Buffon, the inhabitants of Paraguay are much affected with the ichthyosis, or a complaint much resembling it. "Il regne parmi eux une maladie extraordinaire; c'est une effipie de pêtre qui leur couvre tout le corps, et y forme une creur efemble a des écailles de poisson; cette incommode ne leur cause aucune douleur, ni même aucun autre derangement dans la fanté." (Hist. Naturelle, tom. vii. p. 507.) Some obervations on a diseased state of the skin, analogous to the ichthyosis above described, appear in the Philosophical Transactions, vol. xiv. N° 16O; and a striking instance of the same, though somewhat differently modified, is inserted in the same collection, N° 424, the sequel of which is given in vol. xlix. (part i. for the year 1755.) See also a cafe slightly detailed by Panarolus (Pentecole, vol. iii. p. 219), and another related by Stalpart Vander Viel, ob. 35. centii.

With refpect to the cure, little more seems to be known than of the cauces of this eruption. Dr. Willan merely observes, that, when a portion of the hard scaly coating is removed, it is not soon produced again. The easiest mode, he says, of removing the scales, is to pick them off carefully, with the nails, from any part of the body while it is immersed in hot water. The layer of cuticle, which remains after this operation, is harsh and dry; and the skin did not, in these cafe attended by him, recover its usual texture and softness, but the scales were prevented from forming afterwards, by the repeated use of the warm bath, along with moderate friction.

The disease above described is the Ichthyesis simplex in Dr. Willan's nomenclature; but he describes another species, which he terms I. cornea. This, which he has never seen, is mentioned by authors as "a hoary rigidity of the integuments, impeding the motion of the muscles and joints;" and as affecting the lips, prepuce, toes, fingers, &c.; and sometimes as extended over the whole body. A singular cafe of the latter description is recorded in the Philos. Trans. vol. xlvii. part ii. p. 580. This form of ichthyosis, Dr. Willan remarks, is sometimes attended with the production of horns; a proof that these singular excrences may be cutaneous, or perhaps cuticular, and generated in nearly the same manner as the nails from the human body, or the hoofs and claws of quadrupeds. An account of a girl, whose body was nearly covered with hoary excresences, is given in the Philos. Trans. N° 176. And a horn, similar to those here described, together with a portrait of the woman on whom it grew, is preserved in the British Mupeum. See Willan on Cutan. Dif. Order ii. p. 197, et seq.

ICHTHYOSPENDYLA, in Natural History, is the name by which Mr. Lhuyd denominates the vertebrae, or joints of the back bones of fishes. Lithophyl. tab. 18.

ICHTHYPERIA, the name given by Dr. Hill to the bony palates of fishes, which are frequently found fossil at great
great depths in the earth, and usually immersed in the strata of stone; and in this strata had been named by Mr. Huygh, from their resemblance in shape to the pods of lupines, and some of the other leguminous plants, *Lupinus*. Many from this name, and this close resemblance to the pods of plants, have been milled into the believing them toffills of vegetable origin. But they have plainly all of them been the bony coverings of different parts of the mouths of certain fish of the cartilaginous, and perhaps other kinds, whose principal food being shell-fish, these bony palates were necessary to the eating of them. Many of the ichthyereis are found indeed plainly worn and rounded by use.

They are sometimes found in their fossil state joined to one another; but commonly in single pieces or joints, or in fragments of such. They are of the same substance with the bufonite, and their shape depends on the species of fish, or part of the mouth, to which they belonged. But their most usual figure is that of half the shell of the pod of a lupine. Their sizes are various, from the tenth of an inch to two inches in length, and an inch in breadth. Their surface is sometimes smooth and polished; sometimes finely fluted or fluted, and sometimes wholly covered with tubercles. They are also found of very different colours; but most frequently either black, or of a dark chestnut colour.

They are found lodged and bedded in the strata of stone, in Germany, Italy, and France, and in the islands of the Archipelago, and in Syria among the spines of the echini; but they are nowhere so frequent as in England, there being with us very few quarries of stone which do not afford more or less of them. Hill’s *Hift. of Fossil*, p. 645.

*ICHTHYS*, a fish, in *Antiquity*, a famous acrostic of the Erythraean libly, mentioned by Eusebius and St. Augustine; the first words of every verse of which made up ruins: *Ναξια* οἱκος Ἰησοῦς Χριστός Διὸς θεὸς, εὐαγγέλιον, the initial letters of which compose the word ichthys, ΙΧΘΥΣ.

*ICHTHYS*, in *Ancient Geography*, a promontory of the Peloponnese. *Ptolemy*.

*ICICA*, in *Botany*, Aublet. *Guian* t. 130—135. See *Amris*.

*ICICA*, in the *Materia Medica*, a name given by some to the gum elemi.

*ICICARIBA*, in *Botany*, a name used by some authors for the tree which affords us the gum elemi, used in medicine.

*ICOA*, the name of a genus of plants, described by Pluviar; since called by Linnaeus *Erythrobalanus*.

*ICOLM-KILL*, in *Geography*. See *IONA*.

*ICON*, in *Natural History*, signifies a figure, cut, or engraving, of any subject in natural history.

*ICON*, in *Ruins*, the fame with image.

*ICONUM*, in *Ancient Geography*, a town of Cappadocia, in the department of Lycaonia. In the time of *Xenophon* it belonged to Phrygia. This town still subsists under the name of Koniue, or Cogni.

*ICONOCLASTS*, or *ICONOCLASTE*, formed from *ikon*, image, and *klaste*, to break, in *Ecclesiastical History*, breakers of images; a name which the church of Rome gives to all who reject the use of images in religious matters.

In this sense, not only the reformed, but some of the eastern churches, are called iconoclasts, and are all esteemed by them heretics, as opposing the worship of the images of God, and the saints, and breaking their figures and representations in churches.

The opposition to images began in Greece under the reign of Bardanes, who was created emperor of the Greeks a little after the commencement of the eighth century when the worship of them became common. (See *Image*). But the tumults occasioned by it were quelled by a revolution, which, in 713, deprived Bardanes of the imperial throne. The dispute, however, broke out with redoubled fury under Leo the Iaurian, who issued an edict in the year 726, abrogating, as some say, the worship of images, and ordering all the images, except that of Christ's crucifixion, to be removed out of the churches; but according to others, this edict only prohibited the paying to them any kind of adoration or worship. This edict occasioned a civil war, which broke out in the islands of the Archipelago, and, by the fugitivities of the priests and monks, ravaged a part of Asia, and afterwards reached Italy. The civil commotions and insurrections in Italy were chiefly promoted by the Roman pontiffs, Gregory I. and II. Leo was excommunicated, and his subjects, in the Italian provinces, violated their allegiance, and rising in arms, either massacred or banished all the emperor's deputies and officers. In consequence of these proceedings, Leo assembled a council at Constantinople in 755, which degraded Germanus, the bishop of that city, who was a patron of images, and he ordered all the images to be publicly burnt, and inflicted a variety of severe punishments upon such as were attached to that idolatrous worship. Hence arose two factions; one of which adopted the adoration and worship of images, and on that account called Iconodulu or Iconolatres; and the other maintained that such worship was unlawful, and that nothing was more worthy the zeal of Christians than to demolish and destroy those statues and pictures, which were the occasions of this gross idolatry; and hence they were distinguished by the titles of iconomachi, from *ikon*, image, and *machi*, I contend, and Iconocaste. The zeal of Gregory II. in favour of image-worship, was not only imitated, but even surpassed by his successor Gregory III. in consequence of which the Italian provinces were torn from the Grecian empire.

Constantine, called Copronymus, from *Kopos*, tumult, and *Nymph*, nymph, because he was said to have defiled the sacred font at his baptism, succeeded his father Leo in 741, and in 745 convened a council at Constantinople, regarded by the Greeks as the seventh eccumenical council, which solemnly condemned the worship and use of images. Those who, notwithstanding this decree of the council, raised commotions in the state, were severely punished; and new laws were enacted, to set bounds to the violence of monastic rage. Leo IV. who was declared emperor in 775, purified the state manners, and had recourse to the coercive influence of penal laws, in order to extirpate idolatry out of the Christian church. Irene, the wife of Leo, poisoned her husband in 780; assumed the reigns of empire during the minority of her son Constantine, and in 786 summoned a council at Nice in Bithynia, known by the name of the second Nicene council, which abrogated the laws and decrees against the new idolatry, restored the worship of images and of the crofs, and denounced severe punishment against those who maintained that God was the only object of religious adoration. In this contest, the Britons, Germans, and Gauls, were of opinion, that images might be lawfully continued in churches, but they considered the worship of them as highly injurious and offensive to the Supreme Being. Charlemagne distinguished himself as a mediator in this controversy; he ordered four books concerning images to be composed, refuting the reasons urged by the Nicene bishops to justify the worship of images, which he sent to Adrian, the Roman pontiff, in 790, in order to engage him to withdraw his approbation of the decrees of the last council of Nice. Adrian wrote an answer;
answer; and in 794, a council of three hundred bishops, assembled by Charlemagne at Frankfort on the Main, confirmed the opinion contained in the four books, and solemnly condemned the worship of images. In the Greek church, after the banishment of Irene, the controversy concerning images broke out anew, and was carried on by the contending parties, during the half of the ninth century, with various and uncertain success. The emperor Nicephorus appears, upon the whole, to have been an enemy to this idolatrous worship. His successor, Michael Caropolates, surnamed Rhan-gabe, patronized and encouraged it. But the scene changed on the accession of Leo the Armenian to the empire; who assembled a council at Constantinople in 814, that abolished the decrees of the Nicene council. His successor Michael, surnamed Balaus, disapproved the worship of images, and his son Theophilus treated them with great severity. However, the empress Theodora, after his death, and during the minority of her son, assembled a council at Constantinople in 842, which reinstated the decrees of the second Nicene council, and encouraged image worship by a law. The council held at the same place under Photius, in 879, and reckoned by the Greeks the eighth general council, confirmed and renewed the Nicene decrees. In commemoration of this council, a festival was instituted by the superstitious Greeks, called the Feast of Orthodoxy. The Latins were generally of opinion, that images might be suffered as the means of aiding the memory of the faithful, and of calling to their remembrance the pious exploits and virtuous actions of the persons whom they represented; but they detested all thoughts of paying them the least marks of religious homage or adoration. The council of Paris, assembled in 824 by Lewis the Meek, resolved to allow the use of images in the churches, but severely prohibited rendering them religious worship. Nevertheless, towards the conclusion of this century, the Gallican clergy began to pay a kind of religious homage to the images of saints, and their example was followed by the Germans, and other nations. However, the iconoclasts still had their adherents among the Latins; the most eminent of whom was Claudius, bishop of Turin, who, in 823, ordered all images, and even the crofs, to be cast out of the churches, and committed to the flames; and he wrote a treatie, in which he declared both against the use and worship of them. He condemned relics, pilgrimages to the Holy Land, and all voyages to the tombs of saints; and to his writings and labours it was owing, that the city of Turin, and the adjacent country, was, for a long time after his death, much less infected with superstition than the other parts of Europe. The controversy concerning the sanctity of images was again revived by Leo, bishop of Chalcedon, in the eleventh century, on occasion of the emperor Alexius's converting the figures of silver, that adorned the portals of the churches, into money, in order to supply the exigencies of the state. The bishop obstinately maintained, that he had been guilty of sacrilege; and published a treatise, in which he affirmed, that in these images there refided an inherent sanctity, and that the adoration of Christians ought not to be confined to the persons represented by these images, but extended to the images themselves. The emperor assembled a council at Constantinople, which determined, that the images of Christ and of the saints were to be honoured only with a relative worship; and that invocation and worship were to be bestowed on the saints only as the servants of Christ, and on account of their relation to him, as the man of God. Leo, however, even with these absurd and superstitious decisions, was sent into banishment. In the western church, the worship of images was disapproved and opposed by several considerate parties, as the Petronians, Albigeneses, Waldenses, &c. till at length this idolatrous practice was entirely abolished in many parts of the Christian world by the Reformation. Molheim's Eccl. Hist. vol. ii. See Image.

ICONOGRAPHIA, Etymogenes, derived from ἱερογλυφος, and ἱερος, the description of images, or ancient statues of marble and copper; also of busts and semi-busts, penates, paintings in fresco, mosaic works, and ancient pieces of miniature.

ICONOLATRÆ, or ICONOLATERS, from ἱερος, and λατρευω, I worship; or Iconodulæ, from ἱερος, and νομιζω, I suppose, those who worship images; a name which the iconoclasts give to those of the Romish communion on account of their adoring images, and of rendering to them the worship only due to God. See Iconoclasts, and Image.

ICONOLOGIA, formed from ἱερος, and λογος, I speak, the interpretation of ancient images, monuments, and emblems.

ICONOMACHI. See Iconoclasts.

ICOSAHEDRON, in Geometry, a regular body, or solid, terminated by twenty equilateral and equal angles. The icosahedron may be considered as consisting of twenty triangular pyramids, whose vertices meet in the centre of a sphere, imagined to circumscribe it; and, therefore, they all have their heights and bases equal; whereas the solidity of one of these pyramids, multiplied by 20, the number of bafes, gives the solid content of the icosahedron. See Regular Body.

ICOSANDRIA; in Botany, from ἵκος, twenty, and σαρδς, a man, is the 12th clas of the artificial system of Linnaeus, distinguished by having numerous flaments, about 20, or more, inflected into the calyx, not into the receptacle. Such an infention is judiciously pointed out by Linnaeus as an infallible mark that the pulpy fruit of the flowers so constructed may always be eaten in safety. This rule holds good, whatever the number of the flaments may be; as in the fifth clas, where, amongst many plants with poisonous or unwholesome berries, the flaments are differently inflected, is found the Ribes, or Currant and Gooseberry, whose fruit is indicated by the flaments growing out of the rim of the calyx, exactly as in the clas Icosandra. At the same time, the foliage or herbage of such plants is always, more or less, to be mistrusted, being acid, nauseous, or eminently dangerous; witness the Prunus Laurocerasus, or Cherry-laurel, whose essential oil, and even its distilled water, is one of the most potent of vegetable poisons. This dangerous quality refines in the oil of a bitter-almond flavour, observable in most of this tribe, which is rendered less injurious perhaps in the kernels of peaches and apricots, by the mild oil of their cotedons, and always taken by us in too small a quantity to be materially hurtful. It is further remarkable, that as Icosandrous plants, when dried, are peculiarly subject to the deprecatory of insects, the fruit is the cats with all the genus Ribes.

The orders of the Icosandra are distinguished by the number of their flymes. The first, Monogynia, contains the valuable genus Prunus, and its near ally Amygdalus, composed of some of our finest fruits; with Myrtus, &c. The Digiynia, Trigynia, and Pentagynia of Linnaeus are so nearly akin, and so inconstant in the same genus, if not species, that it is found most commodious to unite them under the latter denomination, as the number five most prevails. Polygynia, whose flymes are more than five, is a numerous and very natural order, containing Rosa, Rubus, Fragaria, Potentilla, &c. to which the Sibbaldis naturally belongs, though, having usually but five flaments, it is placed in the clas Pentandria.
ICOSANDRIA is also the name of an order in the classics Polyadelpheia, Monocot, and Dinecia, whole character ought chiefly to depend on the infection, rather than the precise number of its ramens. To this circumstance Linnaeus did not sufficiently advert. Citrus  Polyadelpheia Icosandria, instead of the orders Dodecanthia or Polyadelpheia of that clafs, and on the other hand, excluded Melaleuca, which is truly icosandrous, being the natural family of Myrtæ. S.

ICOSIUM, Algeria, in Ancient Geography, a town of Africa, on the eastern part of Mauritania Caxarenia. Ptolemy mentions it, and the Itinerary places it 47 miles E. of Tipafa. Pliny says that Vepfaiam gave it the name of a Latin city.

ICTERUS, feries, in Medicine, alfo iberico, words from the Greek, signifying Jaundice, which fce. Whence alfo the adjective iberico: thus we faw iberico symptoms, iberico medicines; meaning the symptoms of jaundice; medicines proper for the cure of jaundice, &c.

ICTERUS, in Ornithology, a species of Oriolus, which fce. For other fpecies fee the fame article. See alfo Todas parideus, Sturua coctau, and Musicapapa paradise.

ICTERUS LAPIS, in Natural History, a name given by the ancients to a flone famous for the cure of the jaundice. Pliny describes fpecies of this flone. But thofe descriptions are fo short, that we cannot determine from them which of the flones of thofe known at prefent were intended.

ICTIAR, in the Eastern Military Orders, an officer who has gone through all the degrees or polls in his refpective body; and has a right to be a member of the divan.

Icus, in Ancient Geography, an ifland of the Archipelago, and one of the Cyclades, near Eubea, over-and-again Nitrea. It was fitated in Dardania, at fome distance S.E. of Troy. Here were found the sources of the rivers Simos, Xante, &c. This mountain, however, is in reality a chain of mountains, of which the principal part lay to the E. and near the feite of Troy. Thence it extended to the N.W., W., and S.W., as far as the fea, projecting on four promontories, towards Cicycam, Antandros, the gulf of Adramyttium, and the promontory of Lectum. Homer, therefore, speaks of the Idman mounts. This mountain in its whole extent is a great reveryor of water, and supplied the rivers Eapos and Granicus, which difcharged themfelves into the Propontide; the Simos and Scamander, or Xanthus, which ran into the Hellepont; and the Samoies and Cilo, which paffed into the gulf of Adramyttium. The other Ida is a mountain of Crete, which still retains the name, though it is fometimes called Pulorit, and which has been much celebrated by the poets. It is much the highest mountain in the ifland, though in other respects inferior; it is for the greateft part of the year covered with snow, and fo barren that it produces nothing but the tragacanth. Jupiter is faid to have been fecretly murled on this mountain, and on this account called Idaus.

IDA, in Geography, a mountain of the ifland of Crete, which rifes in the form of a pyramid S. W. of Candia, and serves as a land-mark to navigators, who wish to anchor in the harbour of that town. This mountain is covered with snow almost all the year.

IDAAN, See MAROOT.

IDACIUS, in Biography, an ancient chronicler, was a native of Lamengo, in Spain, and flourifhèd in the fifth century. He wrote a chronicle commencing with the first year of the reign of Theodosius, and ending with the eleventh of that of Leo, A. D. 467. To him is attributed a table of Fañi Confulares, frequently published. The Chronicle and Fañi were published with notes by father Sirmond, at Paris, in 1619.

IDÆL DACTYLI, in Ancient Geography. See DACTYLI.

IDANNA a Vella, in Geography, a town of Portugal, in the province of Beira, near the Spanish Eifremadura. N. lat. 39' 5'. W. long. 6' 48'.

IDEA, in Philosophy, denotes the immediate object of the mind about which we are employed, when we perceive or think of any thing; and this definition of Mr. Locke's is much left exceptionable than that of some other logicians, who define an idea to be a pattern or copy of a thing in the mind.

Thus, when we look at the fun, we do not fee that luminous felf, but its image, or appearance conveyed to the fould by the organ of light; and this image we call idea. See Impreflion and Perception.

The origin of ideas has been a long time disputed among philosophers. Aristotle and the Peripatetics maintained that external objects emit fpecies, images, or forms, which reSEMBle them all around; and that these fpecies, fliking on our fenses, are by them transmitted to the understanding and impressed upon it; and that being material and fensible, they are rendered intelligible by the active intellect; and are at length received by the passive. The followers of Democritus and Epicurus held an opinion, with regard to the flem's of fubtyle matter coming from external objects, similar to that of Aristotle with refpect to his immaterial fpecies or forms. Others are of opinion, that our fous have of themfelves the power of producing ideas of things we would think upon; and that they are excited to produce them by the impressions which objects make on the body, though these impressions are not images in any refpect like the objects that occasioned them. And in this fay they, it is, that man is made after the image of God, and that he partakes of his power; for if God made all things out of nothing, and can reduce them to nothing when he pleases, fo man can create as many ideas as he pleases, and annihilate them when he has done.

Others maintain, that the mind has no occafion for any thing beside itself to perceive objects; and that, by confidering itself, and its own perfections, it is able to discover all things that are without. Whilft Aristotle thought that every object of human understanding enters at firft by the fenses. Plato, on the other hand, had a very mean opinion of all the knowledge we acquire by the fenses. According to him all fience must be employed about these eternal and immutable ideas, which exist before the objects of fense, and are not liable to any change. In this refpect these two philosophers effentially differed; the notion of eternal and immutable ideas, which Plato borrowed from the Pytha-
gorean school, was totally rejected by Aristotle, who maintained it as a maxim, that there is nothing in the intellect, which was not at first in the senses. It seems, however, probable, that the Pythagoreans and Platonists agreed with the Peripatetics in their general theory of perception; viz. that the objects of sense are perceived only by certain images, or shadows of them, let the mind into, as into a "camera obscura." The notions of the ancients with regard to the seat of the soul were very various. But since it has been discovered by the improvements in anatomy, that the nerves are the infirmities of perception, and of the sensations accompanying it, and that the nerves ultimately terminate in the brain, it has been the general opinion of philosophers that the brain is the seat of the soul, and that the soul perceives the images that are brought there, and external things only by means of them. (See Soul.) Many philosophers, ancient and modern, have employed their invention to discover, how we are made to perceive external objects by our senses; and in their sentiments on this subject there seems to be a very general agreement. Plato conceived, that by our senses we perceive merely the shadows of things, and not things themselves; and his shadows may very well represent the species and phantoms of the Peripatetic school, and the ideas and impressions of modern philosophers. Since the time of Des Cartes, the shadows of external objects, called by the ancients species, forms, and phantoms, have been commonly denominated "ideas," and by Mr. Hume "impressions." But all philosophers, from Plato to Mr. Hume, agree in this, that we do not perceive external objects immediately, and that the immediate object of perception must be some image present to the mind.

The ideas by which we perceive external objects are fall by some to be the ideas of the Deity; whilst it has been more generally thought that every man's ideas are proper to himself, and are either in his mind or in his "fenestra," where the mind is immediately present. The former is the theory of Malebranche. This theory seems to have some affinity with the Platonic notion of ideas, adopted with some modification by the philosophers of the Alexandrian school, commonly called the latter Platonists; but it is not the same. It does not appear that either Plato or the latter Platonists, or St. Augustine, or the Mystics, who seem to have inclined to the tenets of the Alexandrian school, thought that we perceive the objects of sense in the divine mind. The theory, therefore, is properly the invention of Malebranche himself. According to his statement, the soul is united with a Being posseled of all perfection, who has in himself the ideas of all created beings. The Deity, then, being always present to our minds in a more intimate manner than any other being, may, upon occasion of the impressions made upon our bodies, discover to us, as far as he thinks proper, and according to fixed laws, his own ideas of the object; and thus we see all things in God, or in the divine ideas. Malebranche, however, distinguishes more accurately than any philosopher had done before, the objects which we perceive from the sensations in our own minds, which, by the laws of nature, always accompany the perception of the object. Although, he says, we see all sensible and material things in God, yet we have not our sensations in him when we perceive any sensible object; in our perception are included both a sensation and a pure idea. The sensation is a modification of the soul, and it is caused in us by God; but as to the idea, joined with sensation, it is in God, and it is in him that we see it. The system of Malebranche, it is plain, leaves out of the presence of a material world, from what we perceive by our senses; for the divine ideas, which are the objects immediately per-

ceived, are the fame before the world was created. He candidly admits this consequence of his opinion; and refers the complete evidence which we have of the existence of matter upon the authority of revelation.

Mr. Norris, an English divine, expounded the system of Malebranche, in his "Effay towards the Theory of the Ideal or Intellectual World," published in two volumes 8vo., 1701. This system was also adopted by many devout people of both sexes in France. It was opposed by St. Grave-land in his "Introduction à la Philosophie," and particularly examined and refuted by Mr. Locke in a small tract which may be found in his "Popular Works." See also Berkeley's Dialogues, 2d ed. p. 257, &c. But the most formidable antagonist of Malebranche was his own countryman, Antony Arnauld, an acute writer in favour of the Jansenists. (See his article.) In the year 1683 he published his book of "True and False Ideas," in opposition to the system of Malebranche. Arnauld maintains, that ideas are modifications of our minds; and finding no other modification of the human mind which can be called the idea of an external object, he says it is only another word for perception. Ideas, considered as certain representative images, by which external objects are perceived existing either in the human or divine mind, are, according to Arnauld, mere chimeras, fictions of philosophers; there are no such beings in nature; and therefore, he says, it is to no purpose to inquire, whether they are in the divine or in the human mind. The only true and real ideas are our perceptions, which are acknowledged by all philosophers; and by Malebranche himself, to be acts or modifications of our own minds. Arnauld, however, did not totally deny the existence of ideas in the philosophic sense of that word, nor adopt the notion of the vulgar, who acknowledge no object of perception but the external object. He formally maintains, that the modes of expression common among philosophers, viz. "that we perceive not things immediately; that like ideas of them are the objects of our thoughts; and that it is in the idea of every thing that we perceive its properties," are not to be rejected, but are true when rightly understood. By endeavouring to reconcile these expressions to his own definition of ideas, he embarrased himself and his subject.

The common theory of ideas is in general, as we have already stated, that we perceive external objects by certain images which are in our minds, or in the fenestrum to which the mind is immediately present. These images have been variously denominated. Since the time of Des Cartes they have been called ideas. The Cartesians divided their ideas into three classes; those of sensation, of imagination, and of pure intellect. Of the objects of sensation and imagination, they thought the images are in the brain, but of objects that are incorporeal, the images are in the understanding, or pure intellect. Mr. Locke, taking the term idea in the same sense with Des Cartes, divides ideas into those of sensation and those of reflection; meaning by the first, the ideas of all corporeal objects, whether perceived, remembered, or imagined; by the second, the ideas of the powers and operations of our own minds. What Mr. Locke calls ideas, Mr. Hume divides into two distinct kinds, "impressions" and "ideas." The difference between these, he says, consists in the degrees of force and liveliness with which they strike upon the mind. Under impressions he comprehends all our sensations, passions, and emotions, as they make their first appearance in the soul. By ideas he means the faint images of the working and reasoning. Dr. Hartley gives the same meaning to ideas as Mr. Hume does, and what Mr. Hume calls impressions he calls 4 K 2 sensations,
femotions, conceiving our femotions to be occasioned by
vibrations of the infinitesimal particles of the brain, and ideas by
miniature vibrations, or vibratuncles.

Descartes, who contributed to overturn the Peripatetic
system and the authority of Aristotle, took it for granted, as
other philosophers had done before him, that he did not per-
ceive external objects themselves, but certain images of them
in his mind called ideas, and hence it is said he was led to
doubt the report of his senses without collateral proof of
their veracity. The impressions made upon our organs,
nerve, and brain, could be nothing, according to his philo-
sophy, but various modifications of extension, figure, and
motion. There could be nothing in the brain like sound or
colour, taste or smell, heat or cold: these are femotions in
the mind, which, by the laws of the union of soul and body,
are raised on occasion of certain traces in the brain; and al-
though he gives the name of ideas to these traces in the
brain, he does not think it necessary they should be per-
fectly like to the things which they represent, any more than
that words or signs should resemble the things they signify.
But he adds, that we may follow the received opinion as far as
possible, and may allow a slight resemblance. As to the place
of these ideas or images of external objects, which are the immediate objects of perception,
he sometimes refers them to the brain, not only when they are perceived, but when they are remembered or imagined.
and this has been held to be the Cartesian doctrine; yet he
sometimes says, that we are not to conceive the images
or traces in the brain to be perceived, as if there were eyes
in the brain; but these traces are only occasions on which,
by the laws of the union of the soul and body, ideas are
excited in the mind; and therefore it is not necessary that
there should be an exact resemblance between the traces and
the things represented by them. Descartes, it is well
known, made the effence of the soul to consist in thought:
he would not allow it to be an unknown somethings that
had the power of thinking; it cannot therefore be with-
out thought; and as he conceived there can be no thought
without ideas, the soul must have had ideas in its first
formation, which, of consequence, are innate. See Card-
olian Philosophy.

Mr. Locke produced a revolution in the modes of think-
ing among metaphysicians by his celebrated "Essay on
the Human Understanding," a work, which brought men to
think with precision on the philosophy of the human mind,
as1 which contributed at the same time to infuse them with
that candour and love of truth, which are the gen-
ue spirit of philosophy. Locke and Descartes differed con-
cerning the origin of our ideas. The Cartesian thought
that some of them were innate; but he demonstrated that
all our ideas are owing to our senses; and that all innate,
created, and fictitious ideas, are mere chimeras.

Our mind, he thinks, has not absolutely any ideas besides
those presented to it by the senses, and those which it forms
by its own operations on those others which the senses furn-
ished; so that a man, delitute of one of his senses, would
never have any idea belonging to that sense; and, supposing
him delitute of all the senses, he would never have any
idea at all; external objects having no other way of pro-
ducing ideas in him, but by means of sensation, he would
have no ideas, not even of reflection; because, in want-
ing all sensation, he wants that which would excite in him
the operations of his mind, which are the objects of his
reflection.

It is plain, therefore, there is no innate idea; no general
truth, or first principle, inherent in the soul, and created
with it; no immediate object of the mind, before it had
perceived external objects by means of the senses, and re-
flected on that perception. Those ideas only seem to be
innate, because we find we have them as soon as we
come to the use of reason; but they are, in effect, what
we formed from the ideas with which the mind was infen-
sibly filled by the senses. Thus, when the mind is em-
ployed about sensible objects, it comes by the ideas of bit-
ter, sweet, yellow, hard, &c. which we call sensation; and,
when employed about its own operations perceiving and re-
flecting on them, as employed about the ideas before
got by sensation, we get the ideas of perception, thinking,
doubting, willing, &c. which are called inward sensation,
or reflection; and these two, viz. external material things,
as the objects of sensation, and the operations of our
own minds, as the objects of reflection, are the only originals
whence all our ideas have their rise. When we have con-
 sidered these, and their several modes and combinations, we
shall find, that they contain our whole flock of ideas, infor-
mal, that the understanding does not seem to have the
least glimmering of any ideas, that it did not receive from
one of those sources.

Thus far the mind appears merely passive, as not hav-
ing in its power to determine whether it will have these
first beginnings, or materials of knowledge, or not. For
the objects of sense will obtrude their ideas upon the mind;
and the operations of the mind will not let us be without
some (however obscure) notion of them.

Mr. Locke ascribes likewise to the mind the power of
compounding its simple ideas into complex ones of various
forms; of repeating them, and adding the repetitions to-
gether; of dividing and classing them; of comparing them,
and from that comparison, of forming the ideas of their
relation; say, of forming a general idea of a species or gen-
us, by taking from the idea of an individual every thing by
which it is distinguished from other individuals of the kind,
until at last it becomes an abstract general idea, common
to all the individuals of the kind. (See Abstraction.) For
the ideas which we have of the different qualities of bodies,
according to Locke, we refer to the article Quality.

From the systern of Mr. Locke and of other philosophers,
who considered ideas as the immediate objects of all thought,
the ingenious bishop Berkeley (see his articles) inferred, and
undertook to demonstrate, that there is no such thing as
matter in the universe, but that all which it contains may
be reduced to mind, and ideas in the mind. "It is evi-
dent," says he in the first sentence of his Principles of
Knowledge, &c. "to any one who takes a survey of the
objects of human knowledge, that they are either ideas actu-
ally imprinted on the senses; or such as are perceived, by
attending to the passions and operations of the mind; or
haly, ideas formed by help of memory and imagination,
either compounding, dividing, or barely representing
those originally perceived in the foresaid ways." See Exis-
tence and Matter.

Berkeley's system was adapted by Mr. Arthur Collier,
rector of Langford Magna, near Sarum in Wiltshire, who
published a book in 1713, which he called "Clavis Univer-
salis, or a New Enquiry after Truth; being a demonstration
of the non-existence or impossibility of an external world."
Bishop Berkeley has widely deviated from the common sys-
tem with regard to ideas, distinguishing between ideas and
notions. He specifies two kinds of ideas, those of sense and
those of imagination. "The ideas imprinted on the
senses by the Author of Nature," he says, "are called real
things; and those excited in the imagination, being less reg-
ular, vivid, and constant; are more properly termed ideas,
or images of things, which they copy and represent. But
then
If such a connection took place, what is supposed concerning obscure ideas would be true in a certain sense; to visit, that it might be said, that a man who has a distinct idea of a triangle, has thereby obscure ideas of all the properties of that figure, because of the necessary connection between those last ideas and the former.

But no such connection between ideas succeeding each other in the soul is perceivable. For if paffing from a dark place to one that is enlightened, I thereby suddenly acquire the ideas of several objects, never before seen, it does not appear that the previous perception of darknes must necessarily lead me to these new ideas.

According to this system, all our perceptions of external objects would be the same, though external things had never existed; our perception of them would continue, although, by the power of God, they should be this moment annihilated. We do not perceive external things because they exist, but because the soul was originally so constituted as to produce in itself all its successive changes, and all its successive perceptions, independently of the external objects.

These and other difficulties may be urged against Mr. Leibniz's system. See Leibnitzian Philosophy.

The ingenious Mr. Harris seems to consider all our ideas as innate; originally impressed on our minds by the Deity, and only awakened or called forth by the presence of external objects. Ideas, he says, are of the essence of mind, and, therefore, having no relation to corporeal things, cannot be produced by them. But this takes for granted a principle which is contrary to all appearance; viz. that the mind is of such a nature as that it can have no possible connection with matter, or be properly affected by it. Whatever be the nature of the thinking principle, it seems agreeable to fact and universal experience to conclude, that it is capable of being affected, either by natural operation or in consequence of an established law, by external objects; and that its perceptions correspond to the state of the corporeal system. Besides, Mr. Harris allows that sensible objects have a natural power of awakening ideas: and why may they not have a natural power of originally exciting them in the same mind? Mr. Harris further argues, that his hypothesis is necessary to account for the identity of the ideas of different minds, which could not be explained, if they were only generated from sensible objects, which are fluctuating and variable.

But it may be replied, that there is an equal identity or diversity in external objects, as there is in our ideas of them; and the correspondence between both is so strict, as to afford a sufficient proof, that our ideas have this origin, and no other. This ingenious writer supposes also, that the mental origin of our ideas is necessary to account for the correspondence subsisting between the ideas of the divine mind and those of our's, and consequently to the communication between him and us. If sensation were the only source of our ideas, this argument would have considerable force; but the contrary appears to be the fact, even upon the system of Mr. Locke, and will be more particularly illustrated in the sequel of this article. See Hermes, p. 380, 394, &c. 399, &c. and Priestley's Examination of Mr. Reid's Inquiry, &c. p. 334. &c.

According to Mr. Hume's system, all perceptions are either impreffions or ideas, comprehending under the first all our sensations, passions, and emotions, and under the second, the faint images of these, when we remember or imagine them; and it is not possible for us so much as to conceive any thing specifically different from ideas and impressions; and since all ideas are copied from impressions, we can therefore have no idea or conception of any thing of which we have
have not received an impression. No man can have any idea of power or energy, because he has never received any impression of it; and for the same reason no man can have any idea of self. What we call a body is only a bundle of sensations; and what we call a mind, is nothing but a bundle or collection of different perceptions, or of thoughts, passions, and emotions, which succeed each other with inconceivable rapidity, and are in a perpetual flux and movement, without any subject. There is properly, says Mr. Hume, no simplicity in the mind at one time, nor identity at different times, whatever natural proposition we may have to imagine that simplicity and identity. They are the successive perceptions only that constitute the mind; so that there is nothing in the universe but impressions and ideas; all possible perceptions being comprehended in those two classes. Consequently, this philosophy, excluding body and mind, admits of no existence whatsoever, not even of a perceiving being to be the subject of these perceptions.

Dr. Price, in his "Inquiry into the Original of our Ideas," has taken occasion to remark, that the system of Mr. Locke, which ascribes all our ideas to sensation and reflection, is materially defective; for, if by sensation we understand the effects arising from the impressions made on our minds by external objects, and by reflection the notice which the mind takes of its own operations, it will be impossible to derive some of the most important of our ideas from them. This excellent reasoner observes, that the power within us that understands, the intuition of the mind, or the faculty in it that discerns truth, that views, compares, and judges of all ideas and things, is a spring of new simple ideas, or original, primary, and uncompounded perceptions of the mind. To this source he refers our ideas of the impenetrability and *vicinity* of matter, subsistence, duration, space, infinity, necessity, contingency, possibility, impossibility, power, causation, &c. all our abstract ideas (see *abstraction*), and also our ideas of moral right and wrong, and of moral obligation. It is, he says, of the essence of these ideas to imply something true or false of an object, and that they by no means denote the manner in which we are affected by it; so that they cannot, with any propriety, be referred to that part of our constitution, which has been distinguished by the appellation of sense. Accordingly, our ideas may be divided, first, into those implying nothing real without the mind, or nothing real and true, besides its own affections and passions; to which clafs we may refer the immediate effects of impressions on the bodily senses, without supposing any previous ideas, as all tastes, smells, colours, &c. and those that arise upon occasion only of other ideas; as the effects in us of considering order, happiness, the beauties of poetry, painting, &c. Secondly, into those which are images of something distinct from sensation, or which imply real, independent existence and truth; which may be subdivided into such as denote the real properties of external objects, and the actions and passions of the mind; and those which are derived immediately from intelligence. By the notices conveyed to the mind through the organs of the body, or its observation of the necessary attendant and concomitant of certain sensations and impressions, it perceives the figure, extension, motion, and other primary qualities of material substances; by contemplating itself, it perceives the properties of spiritual substances, volition, consciousness, memory, &c. To all these ideas it is essential that they have real, certain, invariable archetypes, actually existing, to which they are referred, and to which they are conformable. These ideas again become objects or archetypes to the intellectual faculty from whence arises a new set of ideas, which are the perceptions of this faculty, and represent not the mind's own affections, but necessary truth. Antecedently to these, whatever other ideas we may be furnished with, nothing is understood; whatever feeds or subjects of knowledge may be in the mind, nothing is known. Price's Review, &c. of Morals, sect. 2 and 3.

The system of Mr. Locke, with regard to the origin of our ideas, has been lately attacked with considerable force of argument as well as confidence by Dr. Reid and others; and it has been charged with being the foundation of universal scepticism.

Dr. Reid suggests that Mr. Locke has been sometimes misled by the ambiguity of the word idea, which he often uses in different senses. In common use this word has two meanings, viz. a popular and a philosophical. In the popular meaning, to have an idea of any thing, signifies nothing more than to think of it. But philosophers, ancient and modern, have maintained, that the operations of the mind, like the tools of an artificer, can only be employed upon objects that are present, in the mind, or in the brain, where the mind is supposed to reside. Therefore, objects that are distant in time or place, must have a representative in the mind, or in the brain; some image or picture, which is the object contemplated by the mind. This of late has been called an *idea*, and every thought is conceived to have an *idea* of its object. Hence it has happened, that philosophers have been apt to confound the operation of the mind in thinking with the idea or object of thought, which is supposed to be its inseparable concomitant. Thought, and the object of thought, however, are different things, and ought to be distinguished.

Mr. Locke is charged with using the word idea, without any intimation of the ambiguity of the word, sometimes to signify thought, or the operation of the mind in thinking, and sometimes to signify those internal objects of thought which philosophers suppose; and this, it is apprehended, is the true source of several paradoxical opinions that occur in his excellent work. In explaining this word, Mr. Locke says that he uses it for whatever is meant by thing, notion, species; so that we have here three synonyms for the word idea. The first and last are very proper to express the philosophical meaning of the word, being terms of art in the Pantheistic philosophy, and signifying images of external things in the mind, which, according to that philosophy, are objects of thought. But the word *notion* is a word in common language, whose meaning agrees exactly with the popular, but not with the philosophical, meaning of the word *idea*. The frequent use of the word in these two senses is the cause of confusion and of misapprehension in the reader. Besides, there is a third sense in which he uses the word, and that is to denote objects of thought that are not in the mind, but external. Thus we see, that the word has three different meanings in the "Essay;" and the author seems to have used it sometimes in one, and sometimes in another, without being aware of any change in the meaning. The reader slides easily into the same fallacy.

Dr. Reid objects to every system which supposes that the mind receives images of things from without, by means of the senses, because sensations bear no resemblance to bodies or any of their qualities. With regard to extension, figure, motion, &c. he says, if they are not ideas of sensation, nor like to any sensation, then the ideal system is a rope of sand, and all the laboured arguments of the sceptical philosophy against a material world, and against the existence of every thing but impressions and ideas, proceed upon a false hypothesis. To this objection it has been replied, that ideas are only, in a figurative sense, the images of external things; that certain impressions are conveyed to the
the mind by means of the organs of sense, and their corresponding nerves, between which, and the sensations existing in the mind, there is a real and necessary, though at present an unknown connection; and that the same reasoning would lead him to deny, that sounds are produced by bodies striking against one another, because he can perceive no proper resemblance between the cause and the effect.

Dr. Reid farther objects to the notion generally received among philosophers, that the images of external objects are conveyed by the organs of sense to the brain, and there perceived by the mind. But from this objection it might be inferred, that the whole system of our senses, nerves, and brain, is of no real use whatever; because it is impossible to lay how they act upon the mind, or the mind upon them.

It is also objected, that Mr. Locke’s division of ideas into those of sensation, and those of reflection, is contrary to all the rules of logic; because the second member of the division includes the first. For can we, says he, form clear and just notions of our sensations any other way than by reflection? Sensation is an operation of the mind of which we are conscious, and we get the notion of it by reflecting upon that which we are conscious of. In like manner, doubting and believing are operations of the mind, whereof we are conscious, and we get the notion of them by reflecting upon what we are conscious of. The ideas of sensation, therefore, are ideas of reflection, as much as the ideas of doubting or believing, or any other idea whatsoever. But it has been alleged, that the author confounds the ideas of sensation with the idea of sensation itself; which is, without doubt, of the same class with the idea of doubting, &c. as Mr. Locke would have allowed. But the ideas belonging to the class of sensation do not require any distinct knowledge of that power, or any reflection upon it. If this were the case, brute animals, having no proper ideas of reflection, could have no ideas of sensation; and the same would be the case with the bulk of mankind. In another place, Dr. Reid acknowledges, that human beings may have ideas of mere sensation some time before they discover any power of reflection, and that this power may discover itself, and come into exercise afterwards.

Against the philosophical opinion of the "Essay" and its advocates, Dr. Reid sums up his objections in the following reflections, which we shall briefly mention, without any further detail, which our limits will not allow. 1. This opinion is directly contrary to the universal sense of men who have not been instructed in philosophy. 2. The authors who have treated of ideas have generally taken their existence for granted, as a thing that could not be called in question; and such arguments as they have mentioned incidentally, in order to prove it, seem too weak to support the conclusion. 3. Philosophers, notwithstanding their unanimity as to the existence of ideas, hardly agree in any one thing else concerning them. If ideas be not a mere fiction, they must be, of all objects of human knowledge, the things we have been accustomed to know, and to be acquainted with; yet there is nothing about which men differ so much. 4. Ideas do not make any of the operations of the mind to be better understood, although it was probably with that view that they have been first invented, and afterwards so generally received. 5. The natural and necessary consequences of this theory furnish a just prejudice against it to every man who pays a due regard to the common sense of mankind.

Reid farther observes, that, according to Mr. Locke’s system, ideas being the only objects of thought, and having no existence but when we are conscious of them, it necessarily follows, that there is no object of our thought which can have a continued and permanent existence. Body and spirit, cause and effect, time and space, to which we were wont to ascribe an existence independent of our thought, are all turned out of existence by this short dilemma. Either these things are ideas of sensation or reflection, or they are not; if they are ideas of sensation or reflection, they can have no existence but when we are conscious of them; if they are not ideas of sensation or reflection, they are words without any meaning. To which we shall only reply, that we have the same reason to believe, that mind exists as that body exists; since it is only by that name that we distinguish the subject of certain powers or properties of which we are conscious, as perception, memory, will, &c. and we have just the same reason to believe the identity of an idea as that of any external body, or that of our own minds.

Dr. Beattie, Dr. Oswald, and others, have pursued and extended the same kind of reasoning against the principles of Mr. Locke; and alleged, that Berkeley’s reasoning against the existence of a material world, and Hume’s reasoning against the existence both of soul and body, are deduced from Locke’s Essay, and the Principia des Cartes. For an account of Berkeley’s system, see abstraction, body, and existence.

In opposition to this system, Dr. Reid, and those who have adopted his theory, have recurred to certain inductive principles; alleging, that our perceptions necessarily imply the belief of the present existence of external objects; and that the real, separate, and independent existence of matter is believed, not because it can be proved by argument, but because the constitution of our nature is such, that we must believe it; and that we cannot in our own minds separate the belief of external objects from our sensations. However, it has been urged by an ingenious writer, that Mr. Locke’s doctrine is not so favourable to Mr. Berkeley’s theory as Dr. Reid’s; and that a system which ascribes our primary mental operations to mere constitution and feeling, is more favourable to scepticism than that in the room of which it is substituted.

For an account of Dr. Hartley’s system of the generation of our ideas, see association, vibration, and vibration.

The term idea has, by Mr. Locke, been extended to everything we know or have any notion of, any thing about which the mind is employed in thinking. But this extensive use of the term idea is thought improper by a very ingenious and acute writer, who observes, that we may be said to have some knowledge or notion of our own minds; of spirits and active beings, whereof in a strict sense we have not ideas. In like manner, we know and have a notion of relations between things or ideas, which relations are distinct from the ideas or things related, inasmuch as the latter may be perceived by us, without our perceiving the former. The same author elsewhere observes, that by mind, spirit, soul, or self, he does not denote any one of his ideas, but a thing entirely distinct from them; wherein they exist, or, which is the same thing, whereby they are perceived; for the existence of an idea consists, as he says, in being perceived. He also observes, the word thing, or being, is the most general name of all, and comprehends under it two kinds entirely distinct and heterogeneous; having nothing common but the name,
to wit, spirits and ideas. And in another part of his treatise, he expressly affirms, there can be no idea formed of a soul or spirit. Berkeley's Princ. of Human Knowledge. § 27, 80. 142.

Another author has also blamed Mr. Locke for confounding ideas and notions. He observes, that by idea, according to the common and most usual signification of the word, is meant the image, picture, or representation in the mind of a sensible appearance, or of an object which hath before been perceived by sense. To which sensible appearance therefore the idea necessarily refers, for whatever is in it, or upon any account can be ascribed to it; and it serves, or is made use of in its stead, for the mind to contemplate or employ itself about in thinking, at such time when the object it represents is not immediately perceived, as in the act of sense. Vide p. 105, 106 of a book, intitled "Two Dissertations concerning Sense and the Imagination, with an Essay on Confusions." Lond. 1728. 8vo.

This author farther affirms, in opposition to Mr. Locke, that the perception of an idea is not an act of the understanding. He urges, that an idea, by Mr. Locke's own account of it, is an object, or something perceived, and about which the mind is employed in thinking. Wherefore if perception (suppose), which is an operation or act of the mind, should itself be considered as an idea (and under this very title Mr. Locke treats of perception), then one idea would be the object of another idea, and so there would be an idea of an idea, or an object of an object; and one idea would perceive another idea, which there is no making any tolerable sense of. And indeed in expressing or declaring the operation of any faculty, to give it the same name and appellation with the object itself about which it is employed, and which there is a necessity of considering, in order to set forth the particular quality and nature of the operation, and the precise manner of its concerning and having to do with the object, seems very inconsistent with such a purpose or design.

This author has been very elaborate in proving and enforcing the distinction between notions and ideas. In another treatise he observes, that Mr. Locke, in his Essay on Human Understanding, takes no notice of rational notions, and thereby has not only given a partial and imperfect account of his subject, but made an unjust and unfair representation of it. Vide an Essay concerning Rational Notions, printed at London, 1723.

That some confusion may have arisen from giving the same name to these heterogeneous things, cannot be questioned. However, Mr. Locke is, in this respect, no more guilty than Malebranche and the Cartesian, who use the term idea in the same extensive sense with him, and from whom, indeed, he seems to have taken it. But then the Cartesian seem to have been more solicitous to distinguish between the ideas of the imagination, and those of the intellect, understanding, or de l'esprit pur, as they sometimes express themselves, and have thereby guarded against the inconveniences arising from the too general signification of the term idea. See Notion.

Ideas, according to Mr. Locke, are divided into simple and complex.

Ideas, simple, include all those which come into the mind by sensation; and though the qualities of bodies that affect our senses, are, in the things themselves so mixed and united, that there is no separation between them, yet the ideas they produce in the mind are simple and unmbined. Some of these ideas we acquire purely by means of one sense; as the ideas of colours, only, by the eye; of sounds by the ear; of heat by the touch, &c. Other ideas we gain by several senses, as of space, extension, figure, red, motion, &c. for these have their effect both on the sight and the touch. Others, again, are had from reflection only; such as those of perception and willing. There are other simple ideas again, formed in the mind both by sensation and reflection jointly, as those of shape, pain, power, existence, unity, succession, &c. And some of these kinds of ideas are all, or at least the most considerable, of those simple ideas which the mind hath, and out of which is made all its other knowledge.

The better to comprehend the nature of simple ideas, it will be convenient to distinguish between them, as they are ideas of perceptions in our minds, and as they are modifications of the bodies that cause such perceptions in us, that we may not think, as is usually done, that they are exactly the images and resemblances of something inherent in the object; for most of those of sensation are in the mind no more the likeness of anything existing without us, than the names that stand for them are the likeness of the ideas.

But here the qualities of bodies which produce those ideas in our minds, are to be distinguished into primary and secondary. Primary qualities are such as are utterly inseparable from the body, in what state ever it be, and such as our senses constantly find in every particle of matter; which are solidity, extension, figure, mobility, and the like. Secondary qualities are such as are, in reality, nothing in the objects themselves, but only powers to produce various sensations in us, by means of their primary qualities: that is, by the figure, bulk, texture, &c. of their particles, as colours, sounds, taste, &c.

Now the ideas of primary qualities are, in some senses, resemblances of them, and their patterns do really exist in the bodies themselves; but the ideas produced in us by those secondary qualities have no resemblance of them at all. There is nothing like our ideas existing in the bodies themselves that occasion them: they are, in the bodies we denominate from them, only a power to produce those sensations in us; and what is sweet, warm, blue, &c. in the idea, is no more than the bulk, figure, and motion of the particles of the bodies themselves, which we call so. See Quality.

The mind has several faculties for managing these simple ideas, which are worthy of notice: as, 1. That of discerning justly, and distinguish ing rightly, between one and another; in which consists the accuracy of judgment.

2. That of comparing them one with another, in respect of extent, degree, time, place, or any other circumstances of relation or dependence, one on another.

3. That of compounding, or putting together, the simple ideas received by sensation and reflection, in order to make complex ones.

4. Children, by repeated sensations, having got some simple ideas fixed in their memories, by degrees learn the use of signs, and when they can speak articulately, they make use of words to signify their ideas to others.

Hence, the use of words being to stand as outward marks of our internal ideas, and those ideas being taken from particular things, if every particular idea that we take in should have a particular name affixed to it, names would become endless. To prevent this inconvenience, the mind has another faculty, whereby it can make the particular ideas received from such objects become general; which is done by considering them as they are in the mind, such appearances, separate from all other existences, and circumstances of existence, as time, place, and other concomitant ideas; and objects hereafter to be considered, whereby the ideas, taken from particular things, become general representatives of all of that kind, and their names, general names, ap-
pleasurable to whatever exists conformable to such abstract ideas. Thus, the same colour being observed to-day in chalk or snow, which we observed yesterday in paper or milk, we consider that appearance alone makes it a representative of all of the same kind, and gives it the name of "white"; by which found we always signify the same quality, wherefore to be met with, or imagined.

From the powers of combining, comparing, and separating, or abstracting simple ideas, acquired by sensation and reflection, all our complex ideas are formed; and, as before, in the perception of ideas, the understanding was passive, so here it is active, exerting the power it hath in the several arts and faculties above mentioned, to frame compound ideas.

Ideas, complex, though their number be infinite, and their variety endless, yet may all be reduced to these three heads; viz. modes, substances, and relations. Modes are such complex ideas as, however compounded, are not supposed to exist by themselves, but are considered as dependences on, or affections of, substances: such are the ideas signified by the words triangle, gratitude, murder, &c.

There are of two kinds: 1. Such as are only variations, or different combinations, of the same simple idea, without the mixture of any other; as a dozen, a score, &c., which may be called simple modes. 2. There are others, compounded of simple ideas, of several sorts put together, to make one complex one; as beauty, theft, &c.

Substances have their ideas from such combinations of simple ideas, as are taken to represent distinct particular things subsisting by themselves, in which the supposed or confused idea of substance, such as it is, is always the first and chief.

Relations are a kind of complex ideas, arising from the consideration or comparison of one idea with another. Of these, some only depend on the equality or excess of the same simple idea in several subjects; and these may be called proportional relations; such as equal, more, bigger, fwarner. Another occasion of comparing things together is owing to the circumstances of their origin and beginning; which not being afterwards to be altered, the relations depending thereon as lasting as the subjects to which they belong. Thus it is with natural relations, as father, mother, uncle, cousin, &c. Thus also it is with relations by institution, as prince and people, general and army, &c. As to moral relations, they are the conformity or disconformity of men’s free actions to laws and rules, whether human or divine.

Farther, Ideas may be divided into clear or difficult; and obscure or confused.

Ideas, simple, are clear, when they continue such as the objects present them to us when our organs of sensation are in good tune and order; when our memories retain them, and can produce and present them to the mind whenever it has occasion to consider them; and when, with this, the mind sees that these simple ideas are severally different one from another. The contrary to which is what we call obscurity and confusion of ideas.

A difficult idea is that wherein the mind perceives a difference from all others; and a confused idea is such as is not sufficiently distinguished from another, with regard to which it ought to be different.

Ideas, again, with respect to the objects whence they are taken, of which they are supposed to represent, come under a thousand distinction; being either real or fantastical; true or false; adequate or inadequate.

Ideas, real, are such as have a foundation in nature; or such as have a conformity with the real being or existence of things, or with their archetypes.

Ideas, fantastical or chimirical, are such as have no foundation in nature, nor any conformity with that being to which they are referred, or with their archetypes.

All our simple ideas are real; not that they are images or representations of what does exist, but as they are the certain effects of powers in things without us, ordained by our Maker to produce in us such sensations. They are real ideas in us, because by them we distinguish the qualities that are really in the bodies themselves; their reality lies in the ready correspondence they have with the distinct conceptions of real being; but whether with those conceptions as causes or patterns, it matters not, so long as they are constantly produced by them.

As to complex ideas; in regard they are arbitrary combinations of simple ideas put together, and united under one general name, in forming whereof the mind uses its own liberty, some are found real, and some imaginary. 1. Mixed modes and relations, having no other reality than what they have in the minds of men, are real; nothing more being required to their reality, but a possibility of existing conformable to them. These ideas, being themselves archetypes, cannot differ from their archetypes, and so they cannot be chimirical, unless any one jumbles inconsequent ideas in them; indeed, those that have names assigned to them, ought to have a conformity to the ordinary signification of those names, to prevent their appearing fantastical.

2. Our complex ideas of substances being made in reference to things existing without us, whose representations they are thought to be, are no farther real than as they are combinations of simple ideas really united and co-existing in things without us. Those are fantastical that are made up of several ideas that never were found united, as centaur, &c.

Ideas, real, are divided into adequate and inadequate.

Ideas, adequate, are those which perfectly represent those archetypes which the mind supposes them taken from, and which it makes them stand for.

Ideas, inadequate, are such as do but partially, or incompletely, represent those archetypes to which they are referred.

Ideas, as to true and false, it may be observed, that truth and falsehood, in propriety of speech, belong only to propositions; and when ideas are termed true and false, there is some tacit proposition, which is the foundation of that denomination. Our ideas, being nothing else but appearances or perceptions in the mind, can no more be said to be true or false, than simple names of things can be said to be for; for truth and falsehood lying always in the affirmation or negation, our ideas are not capable of them, till the mind parses some judgment of them. In a metaphysical sense, they may be said to be true, i.e. to be really as they exist; though in things called true, even in that sense, there seems to be a secret reference to our ideas, looked upon as the standards of truth; which amounts to a mental proposition. When the mind refers its ideas to any thing extraneous to it, they are then capable of being true or false; because, in such a reference, the mind makes a tacit supposition of their conformity to that thing; and as this supposition is true or false, so the ideas themselves come to be denominated. Locke’s Essay, 8vo. vol. i. p. 57.

IDEAL, in Painting and Sculpture, is used to signify a perfection in form, and a beauty in colouring, deduced from the general principles of nature; but not to be found in any individual person or thing of compound structure, when considered in all its parts; such as man, for instance.
I E A D.

No man or woman, probably, ever existed possessed of that perfect beauty of form in all their parts, of which those parts are fully capable, consistent with the power to perform their intended functions in the animal economy. Therefore artists who aim at representing the human figure in its utmost perfection, are of course called upon imperatively, to vary in some point or other from their models, and to add the beauties of others. This selection of perfect parts depending entirely upon taste, is that ideal in art, (or \textit{ideale}, a term adopted from the French,) which is the source of so much beauty and character in the works of a few artists, who professed eminent talents; and which, being misunderstood, or attempted without knowledge and true taste, is equally the source of so much vicious affection and frippery in those of the greater part, whose aim is to display it.

Sir John Reynolds, in his letter published in the Iiller, No. 82, has aptly illustrated this subject by observing, that "among blades of grass, or leaves of the same tree, though no two can be found exactly alike, yet the general form is invariable. A naturalist, before he classed one as a sample, would examine many, 

Sir John Reynolds, in his letter published in the Iiller, No. 82, has aptly illustrated this subject by observing, that "among blades of grass, or leaves of the same tree, though no two can be found exactly alike, yet the general form is invariable. A naturalist, before he classed one as a sample, would examine many, and fix on the best one of the kind; he then classed all of the same kind together by the name of the species, as far as he could identify them. The same remark applies to every portion of the figure. The head, the neck, the trunk, and the limbs are found almost as various in form as the features of the face; although the general character is the same in all; and fixed for every period of the life of man. In childhood, youth, manhood, and declining years, there are distinct and universal characteristics, whilst each individual in the separate classes is known by his peculiar variations of form and features. It is the duty of the artist who practises in the higher walks of art, to paint man and not individuals; to learn the general character of the objects here to represent, and neglect the trifling peculiarities attached to each.

But this sublime branch of study in art may be, and has been, carried to excess. It properly belongs only to one kind of subject, that is, in its more important application; viz. the representation of exalted and heroic characters; and of scenes, where the actors are few. Those subjects which relate to the common transmutations of mankind, do not so positively require it. In them a greater degree of precise imitation is allowed, indeed required; and where many figures are introduced, the variety of characters requisite, will demand variations from the central form. But even then, unless the scene is taken from vulgar ordinary life, the different characters must not be too minutely wrought. It is true, a thin man must be represented fimbriæ of flesh; and a fat one profusely redundantly; but then all the wrinkles commonly attendant upon both are not necessary to mark their characters. Judgment and taste alone can select those which are so; and one of the most difficult lefions an artist has to learn, is, what to omit when he is copying from nature. That much may be omitted, and yet every feature necessary for true and effective representation retained, is evident from every portrait that ever was painted; even by the meanly instructed pencil of Denner, who attempted to represent the hairs of the beard, and the grizzly texture of the skin; and did it with such skill. But are his pictures more like human beings, that is, do they convey an idea of them to the mind of an observer, more strongly than the free and masterly works of Vandyke and Sir J. Reynolds, who totally disregarded those minutiae?

The rejection of those trifling points is the ideal of portrait painting, and what alone raises it to an exalted rank in the scale of art. Without it, the painter of portraits is not a whit more ingenious, or more deserving of elimination, than he who imitates with ingenuity a malodorigous heel, or any other painter of still life.

The same principle holds good in landscape. Trees should be represented with their own peculiar characters, but they need not have all the minute ramifications of their branches exhibited. The \textit{beau ideale} requires in them a general characteristic form; and not too frequent a variety of species. Claude de Lorraine has sometimes carried this too far, and made all the trees in a picture of one form, or nearly so. It certainly afflicts in producing simplicity; but in this point nature is so exceedingly lavish of variety, that some of it is necessary to satisfy the eye of one accustomed to observe her productions.

The danger of attempting to produce the ideal in form is that of falling into affectation.

What that ideal in art which should be sought after is, may be learned by studying the works of the ancient Greek sculptors; and observing wherein they differ from the ordinary forms of nature. The opportunities they possessed, which are utterly unknown to the inhabitants of northern Europe, of seeing the human figure constantly naked, and in violent exercise, enabled them more surely to judge of what was most beautiful in the general form; to select such as possessed those beauties; and unite their various perfections. It is said of Zeuxis the painter, that when employed in painting a Venus, he selected twelve of the most lovely women of the country, and combined in one figure, the charms for which each was most conspicuous.

The ideal in art, therefore, is not something more beautiful than nature; but nature in her perfect rate; and he who attempts to produce it by drawing from his imagination rather than by his judgment, will more probably fall into the region of error, than fare to the shade of truth. We shall have occasion to speak more of this when we come to treat of the style in design. See \textit{Style}.

\textit{Ideal Beauty in the Fine Arts}. Painters are allowed to talk of the \textit{beau ideale}, who have nature always fitting to them in some garb or other, and they have only to copy her drees and attitudes. But with respect to music, which is entirely a work of art, and of which the beauties as well as deformities are all ideal, it has been asked by a man of more wit than feeling, what it means to say? \textit{Sensu, que cantuit?} And this interrogator was Fontenelle! the most ingenious and agreeable writer on subjects within his competence, which the French language can boast! Ideal, in the common acceptation of the word, implies something which has no reality, and which only exists in imagination; but in speaking of the fine arts, this expression, so far from being inflate, often describes the highest point of perfection at which they can possibly arrive. It is particularly to painting and sculpture that it has been applied; though it equally belongs to poetry and music. There are arts which imitate nothing, or of which the imitations are accidental and feeble; such are architecture and instrumental music.

Let us consider the constituent parts of music—they con-
The plain, and enthusiastic, thinking man, with an unalienable right to his own existence, determines wherein he is different from all other beings for no motion or thought, considered as at different times, can be the same; each part thereof having a different beginning of existence.

From whence it is plain, that existence itself is the principle individuationis, which determines a being to a particular time and place communicable to two beings of the same kind.

Thus, suppose an atom existing in a determined time and place, it is evident, that, considered in any instant, it is the same with itself, and will be so, as long as its existence continues. The same may be said of two, or more, or any number of particles, whilst they continue together, the mists will be the same, however jumbled; but if one atom be taken away, it is then not the same mist. But in vegetable, the identity depends not on the same mists, and is not applied to the same thing; the reason of this, is the difference between an inanimate body, and a crude mist of matter; this latter being only the cohesion of particles any how united, the other such a disposition of organization of parts, as is fit to receive and distribute nourishment, so as to continue and frame the wood, bark, leaves, &c. (of an oak, for instance) in which consists the vegetable life. That, therefore, which hath such an organization of parts, partaking of one common life, continues to be the same plant, though that life be communicated to new particles of matter vitally united to the living plant. The cafe is not so much different in brutes, but that any one may hence see what makes an animal, and continues it the same.

The identity of the same man likewise consists in a participation of the same continued life, in succeeding particles of matter vitally united to the same organized body.

To understand identity aright, we must consider what idea the word stands for; it being one thing to be the same substance; another, the same man; and a third, the same person. An animal is a living organized body; and the same animal is the same continued life communicated to different particles of matter, as they happen successively to be united to that organized living body; and our notion of man is but of a particular sort of animal. Person stands for an intelligent being, that reason and reflects, and can consider itself the same thing in different times and places, which it doth by that consciousness that is inseparable from thinking. By this every one is to himself, what he calls self, without considering whether that self be continued in the same, or in diverse substances. In this consists personal identity, or the sameness of a rational being; and so far as this consciousness extends backward to any past action, or thought so far reaches the identity of that person. It is the self same now it was then; and it is by the same self, with this present one, and that now reflects on it, that that action was done.

Self is that conscious thinking thing, whatever substance it matters not, which is conscious of pleasure and pain, capable of happiness or misery; and so is concerned for itself as far as that consciousness extends. That with which the consciousness of this present thinking can join itself, makes the same person, and is one itself with it; and so attributes to itself, and owns all the actions of that thing as its own, as far as that consciousness reaches. Personality is something that cannot be divided, or confound of parts. It is in the strictest sense what Leibnitz calls a Monad, which fee; and personal identity implies the continued existence of this indivisible thing called self; which, whatever be its precise nature,
thinks, deliberates, resolves, acts, and suffers. It is not thought, action, feeling; but something that thinks, acts, and suffers my thoughts, actions, and feelings to change every moment; they have no continued, but a successive existence; but that self, or I, to which they belong, is permanent, and has the same relation to all the succeeding thoughts, actions, and feelings, which I call mine. Should it be asked, what evidences have you that there is such a permanent self which has a claim to all the thoughts, actions, and feelings, which you call yours? It is replied, that the proper evidence I have of all this is remembrance, or, as some express it, consciousness.

Consciousness, says the excellent bishop Butler, of what is past, avertens our personal identity to ourselves; yet to say it makes personal identity, or is necessary to our being the same person, is to say, that a person has not exhibited a single moment, nor done one action but what he can remember; indeed, none but what he reflects upon. And one should really think it self-evident, that consciousness of personal identity presupposes, and, therefore, cannot constitute personal identity; any more than knowledge in any other case can constitute truth which it presupposes. Though present consciousness of what we at present do and feel is necessary to our being the persons we now are; yet present consciousness of past actions or feelings is not necessary to our being the same persons who performed those actions, or had those feelings. The identity of persons cannot subsist with diversity of substance; personal identity is, therefore, as Mr. Locke expresses it, the sameness of a rational being; and the question, whether the same rational being is the same substance, needs no answer; because being and substance, in this case, stand for the same idea. Consequently, though the successive consciousnesses which we have of our own existence are not the same, yet they are consciousnesses of one and the same thing or object; of the same per son, self, or living agent. The per son of whose existence the consciousness is felt now, and was felt an hour or a year ago, is discerned to be, not two persons, but one and the same person, and, therefore, is one and the same. Butler's Analogy, Append. Diff. 1.

The identity of a person is a perfect identity: wherever it is real, it admits of no degrees; and it is impossible that a person should be the same in part, and in part different; because, as we have already said, a person is a monad, and is not divisible into parts. But the evidence of identity in other persons besides ourselves admits of various degrees, from what we account certainty to the least degree of probability. But still it is true, that the same person is perfectly the same, and cannot be so in part, or in some degree only. We probably at first derive our notion of identity from that natural conviction which every man has from the dawn of reason of his own identity and continued existence. The operations of our minds are all successive, and have no continued existence; but the thinking being has a continued existence, and we have an invincible belief that it remains the same when all its thoughts and operations change. The evidence we have of our own identity, as far back as we remember, is totally of a different kind from the evidence we have of the identity of other persons, or of objects of sense. The first is grounded on memory, and gives un doubted certainty. The last is grounded on similarity and on other circumstances, which in many cases are not so decisive as to leave no room for doubt. See Reid's Essays, Ef. iii. chap. 4.

This personal identity is the object of reward and punishment, being that by which every one is concerned for himself. If the consciousnes were within with the little finger; when that was cut off it would be the same self, that was just before concerned for the whole body. If the same Socrates, waking and sleeping, did not partake of the same consciousness, he would not be the same person: Socrates waking could not be, in justice, accountable for what Socrates sleeping did; no more than one twin for what his brother twin did; because their outsides were so like that they could not be distinguished.

But suppose I wholly lose the memory of some parts of my life, beyond a possibility of retrieving them, so that I shall never be conscious of them again; am I not again the same person that did those actions though I have forgotten them? I answer, we must here take notice what the word I is applied to, which in this case is the man only; and the same man being presumed to be the same person, I is easily here suppressed to fland also for the same person. But if it be possible for the same man to have distinct, incom miscible consciousnesses at different times, it is past doubt the same man would, at different times, make different persons; which we see is the fens of mankind in the most solemn declaration of their opinions: human laws not punishing the madman for the sober man's actions, nor the sober man for what the madman did; thereby making them two persons.

Thus we say, in English, such a one is not himself, or is beside himself; in which phrase it is intimated, that self is changed, and the self same person is no longer in that man. But is not a man, drunk or sober, the same person? Why else is he punished for the same fact he commits when drunk, though he be never afterwards conscious of it? Just as much the same person as a man that walks and does other things in his sleep, is the same person, and is answerable for any mischief he shall do in it. Human laws punish with a justice suitable to their way of knowledge; because in these cases they cannot distinguish certainly what is real, and what is counterfeit; and so the ignorance in drunkomness, or sleep, is not admitted as a plea. For though punishment be annexed to personability, and personability to consciousness, and the drunkard is not conscious, perhaps, of what he did, yet human judicatures justly punish him, because the fact is proved against him; but want of consciousness cannot be proved for him. But in the great day, wherein the secrets of all hearts shall be laid open, it may be reasonable to think no one shall be made to answer for what he knows nothing of, but shall receive his doom; his own conscience accusing, or else excusing him.

To conclude this article, whatever substance begins to exist, it must, during its existence, be the same; whatever composition of substances begins to exist, during the union of those substances, the concrete must be the same. Whatever mode begins to exist, durin its existence it is the same; and so if the composition be of distinct substances and different modes, the same role holds. Whence it appears, that the difficulty or obscurity that has been about this matter, rather arises from names ill used, than from any obscurity in the things themselves. For whatever makes the specific idem to which the name is applied, if multiplied steadily, to the distinction of any thing into the same and diverse, will easily be conceived. Locke's Essays, vol. i. chap. 27.

IDEO. See IDIOT and LUNATIC.

IDES, Idus, in the Roman Calendar, a denomination given eight days in each month; commencing in the months of March, May, July, and October, on the fifteenth day; and in the other months on the thirteenth day; and reckoned backward, so as in the four months above specified.
IDI specified to terminate on the eighth day, and in the reft on the first.

The origin of the word is contefted. Some will have it formed from 
io, to fea; because the full moon was commonly seen on the day of the ides; others from ides, foventure, on account of the image of the full moon then visible; others from idibus, or avis idalis, a name given by the Etrurians to a victim offered on that day to Jupiter; others from the Etrurian word ider, i.e. divido; because the ides divided the moon into two nearly equal parts.

The ides came between the calends and the nones.

The 15th day in March, May, July, and October, and the 13th of the other months, being called the ides of those months; idus Martius, Maius, &c. the 15th day of the same four months, and the 12th of the other eight, were pridiae idus, or the eve of the ides of March, &c. the 15th day in the four months, and the 11th in the eight, was called the third of the ides of such months, 3 idus Martius, &c. to the 15th day in the four, and the 10th in the eight months, were the fourth of the ides, 4 idus Martius, &c. and thus of the reft, to the eighth and fifth days, which made the eighth of the ides, 8 idus Martius, &c.

This way of accounting is still in use in the Roman chancery, and the calendar of the brevity. The ides of May were consecrated to Mercury; the ides of March were always esteemed unhappy after Caesar's murder; the time after the ides of June was reckoned fortunate for those who entered into marriage; the ides of August were consecrated to Diana, and were observed as a fast day by the slaves; on the ides of September, augures were taken for appointing the magistrates, who formerly entered into their offices on the ides of May, and afterwards on those of March.

IDIÆ, or SCIA, in Geography, a province of Japan.

IDIOM, 1. noun, property, of 
io, proper, own, is sometimes used for the peculiarities of a language; sometimes for a dialect, or the language of some particular province; differing, in some respects, from the language of the nation, in general, whence it is derived.

IDIOMS, Communication of: See Communication.

IDIOPATHIC, in Medicine, an epithet derived from 
io, proper, or peculiar, and 
io, affection, and denoting such an indisposition or disease as properly and originally belongs to the part of the body in which it appears, and is not caused by any other or preceding disease, nor dependent on disease in any other part of the body. Hence idopathic stands in opposition to 
io, or symptomatic, and idio-
pathy (an obsolete term) to 
iotherapy; the 
io or symptomatic affections being such as arise in consequence of some prior disorder in some other part of the body. Thus when vomiting arises from inflammation in the stomach, it is said to be 
iopathic; when it arises from injury done to the brain, from a blow on the kidney, or from the State of the uterus in pregnancy, it is 
iopathic, symptomatic, or 
iosomatic of the diseased state of these different organs.

IDIOSYNCRASY, from 
io, peculiar, or, with, and 
io, temperament, signifies the peculiar disposition or constitution of individuals, in consequence of which particular agents operate upon them, in a manner different from their ordinary mode of action upon persons in general, or peculiar inclinations and avertions, whether in health or sickneds, manifest themselves. Thus certain articles of diet, as shell-fish, bitter almonds, &c. taken in the smallest quantity, immediately excite, in some individuals, an eruption or rash on the skin; which is ascribed to the peculiar idiosyncrasy of such individuals. From a similar cause, the operation of medicines is variously modified; a small dose, which is altogether inert in one habit, will operate violently in another; a drug, which does not offend the stomach, but purges the bowels, in another, will invariably excite vomiting in another; and so on, according to the different idiosyncrasies of each.

IDIOT, Idiot, in the English Law, denotes a natural fool, or a person who hath had no understanding from his birth; and therefore in law presumed never likely to attain any.

The word is originally Greek, idiotes, which primarily imports a private person, or one who leads a private life, without any shame or concern in the government of affairs.

A person who has understanding enough to yard a yard of cloth, number twenty rightly, and tell the days of the week, his parents, his age, &c. is not an idiot in the eye of the law. But a man who is born deaf, dumb, and blind, is confidered by the law in the same state as an idiot; being suppos'd incapable of any understanding, as wanting all those fenses which furnish the human mind with ideas. (4. Init. 238. Com. Journ. 1610.)

For this reason the custody of an idiot and his lands was formerly vested in the lord of the fee (Flet. l. i. c. 1. 5 to 10) and therefore still, by special custom in some manors, the lord shall have the ordering of idiot and lunatic copy-holders (Dyer, 302. Hitt. 17. Noy. 27); but by reason of the manifold abuses of this power by subjects, it was at last provided by common consent, that it should be given to the king as the general conservator of his people; in order to prevent the idiot from walking his estate, and reducing himself and his heirs to poverty and distress. (F. N. B. 223.)

This fixed prerogative of the king is declared in parliament by statute 17 Edw. 11. c. 9, which directs (in accordance with the common law, 4 Rep. 126) that the king shall have ward of the lands of natural fools, taking the profits without waife or destruction, and shall find them necessaries; and after the death of such idiots he shall render the estate to the heirs; in order to prevent such idiots from aliening their lands, and their heirs from being disinflicted. Idiots, and persons of non-fane memory, are not totally disabled either to convey or purchase, but fab modo only. For their conveyances and purchases are voidable, but not actually void. The king, indeed, on behalf of an idiot, may avoid his grants or other acts. See Non-compos.

For the custody of idiots, see Custody.

In criminal cases idiots and lunatics are not chargeable for their own acts, if committed under these incapacities; not even for treason itself. 3. Init. 6. See Lunatic.

If a man be found by a jury an idiot, a naturalty, he may come in person into the chancery before the chancellor, or be brought there by his friends, to be inspected and examined, whether idiot or not; and if, upon such view and inquiry, it appears he is not fo, the verdict of the jury, and all the proceedings thereon, are utterly void, and instantly of no effect. 9. Rep. 31.

Idiotism constitutes an incapacity for entering into the matrimonial contract, in which case it is not valid. (1 Roll. Abr. 357.) It was formerly adjudged that the issue of an idiot was legitimate, and consequently that his marriage was valid. This must have been a strange determination; since consent is absolutely requisite to marriage, and neither idiots nor lunatics are capable of confessing to any thing. And therefore the civil law judged much more sensibly when it made such deprivations of reason a previous impediment; though not a cause of divorce, if they happened after marriage. 23. tit. i. 8. and tit. ii. 16. 16. See Marriage.

Idiot, Idiota, is also used by ancient writers for a person ignorant, or unlearned; answering to illiterate, or inservi-
In this sense, Victor tells us, in his Chronicon, that, in the consistory of Meafala, the holy Gospels, by command of the emperor Ananias, were corrected and amended, as having been written by idiot evangelists: "Tanquam ab idiotis evangelii composita."

Idio, or idiotos, is properly a person in a private station; and to the word should have been rendered, Acts iv. 13, and not "ignorant," an epithet by no means applicable to the apostles Peter and John. The term idiotos is also used, not only in opposition to a public magistrate, but likewise as the appellation of a public speaker; and St. Paul has used it, 1 Cor. vi. 16, in the sense of "hearer." From this epithet, ΙΔΙΟΣ λεγεται, which he himself has affirmed, 2 Cor. xi. 6, some persons have unwarrantably inferred that his language has a tincture of vulgarity. Whereas ΙΔΙΟΣ λεγεται expresses nothing more than a man who is no orator, who pays no attention to the elegance of language, but speaks in the dialect of common conversation. In opposition to ΙΔΙΟΣ λεγεται, St. Paul adds, αλλ' αν γνωσις, in which he was not ΙΔΙΟΣ, but a teacher and apostle. The word may possibly be applied to the deviation from chaste purity observable in the style of St. Paul, which an author who attempted only to please, might have cultivated with more attention; but setting all this aside, the whole expression is applicable to every man who delivers plain truths in artless language. A professor in an university, who is attentive to the accuracy of criticism, but regardless of the graces of composition, is in the strictest sense ΙΔΙΟΣ λεγεται, but the profits of his lands, and the custody of his person, may be granted by the king to some subject, who has interest enough to obtain them. See Idiot.

This hath been long considered as a great hardship upon private families; but few instances occur of the oppressive exertion of it.

IDIOIISM, derived from ΙΔΙΟΣ, proper, peculiar, in Grammar, a phrase, or manner of speaking, peculiar to a language, and which cannot be rendered word for word into any other.

Idiots is defined, by some authors, an inflection of some verb, or a particular construction of some phrase or particle, that is anomalous, and deviates from the ordinary rule of the language of the nation, but which is in use in some particular province of it. Or, it denotes the employing of e. g. an English word in a sense which it bears in some provincial dialect, in low and partial use, and which perhaps the corresponding word bears in some foreign tongue, but unsupported by general use in our own language.

Several authors have written of the idioms in the Greek and Latin languages; that is, of the particular turns in those tongues which vary the most from each other, and from the more popular among the modern tongues; but the examples of theo-idioms being borrowed from the best authors, idioms, in this sense, cannot properly be called an idiocy.

Idiots, taken in the sense of vulgarisms, have been unjustly ascribed to the language of the New Testament. Whilst we cannot contend with Palaret, Blackwell, and others, for the classical purity of the language of the New Testament, we can by no means assert to the declaration of Heumann, who, in his notes on the New Testament, affirms that it is written in the very worst Greek, and in the language of the vulgar; that many words and phrases have been used in a sense unknown to the classics, and given them only by the populace; and that their meaning is not to be discovered by the help of the Greek writers, but merely from conjecture on the general connexion. As the charge of vulgarity has never been proved, and the idioms, which are not so numerous as he has pretended, may be explained by other means than mere conjecture, the whole edifice which he has erected on this basis falls of itself to the ground. Count Zinzendorf is no less mistaken, who has pretended to discover in the sermons of Christ certain idioms, in use only among the common workmen of Nazareth, that is, vulgar Syriac expressions, translated literally into Greek; and this he has attempted to show in passages, where several commentators have discovered mysteries. To this charge it has been replied that rabbinisms, not vulgarisms, must be sought for in the sermons of Christ; for the Jews themselves, allimmited at a language which they did not expect from an education in Nazareth, applied to it an epithet, λειτος λεγεται, Luke iv. 23, which belongs only to the graces of a polished style. See Michaelis's Introd. to the New Testament, by Herb. Maril, vol. i. p. 172.

IDITA, a name, among Hindoo mythology, of Parvati, the comfort of Siva. In this, as well as in numerous other influences, Parvati corresponds in character with the Grecian Diana, who, under the name of Lucina, was invoked by the heathens of Europe, as protecting over child-birth; and was in this character also called Ilythis. So with the Hindoos, Parvati, the Sakti or energy of Siva, the power of reproduction, is invoked, with an appropriate burnt offering of certain perfumes, by women in labour, under the title of Idita, or Iltia; words in Sanscrit implying purific; and applied to the goddesses, because she is purificed by women requiring, or having received, her assistance. See Parvati.

IDLE RIVER, in Geography, in Nottinghamshire and Yorkshire, is navigable from its fall into Trent at Stock with, to the town of Bawtry; as mentioned, with other particulars, in our article Canal. About 21,000 acres of the county of Derby drains to this river; the Strata intersected by its channels, and other particulars respecting the upper parts of this river, will be found in Mr. Parry's Agricultural and Mineral Report on Derbyshire, vol. i.

IDLENESS, in Law. See VAGABOND.

IDOL, from α ἴδω, which signifies the same, of which, image, figure, a statue or image of some false god, to whom divine honours are paid, altars and temples erected, and sacrifices offered.

The idol or image, whatever materials it consisted of, was by certain ceremonies called consecration, converted into a god. While under the artificer's hands, it was only a mere statue.

Three things were necessary in order to change it into a god; proper ornaments, consecration, and oration. The ornaments were various, and wholly designed to blind the eyes of the ignorant and stupid multitude, who are chiefly taken with show and pageantry. Then followed the consecration and oration, which were performed with great solemnity among the Romans.

IDOLA, in Geography, a small island in the Adriatic. N. lat. 44° 15', E. long. 15° 10'.
Several have written of the origin and causes of idolatry: among the old, Vossius, Selden, Godwyn, and Tennison; but it is still a doubt who was the first author of it. It is generally allowed, however, that it had not its beginning till after the deluge: and many are of opinion, that Berosus, who is supposed to be the same with Nimrod, was the first man that was deified.

But whether they had not paid divine honours to the heavenly bodies before that time, cannot be determined: our acquaintance with those remote times being extremely slender.

All that can be said with certainty is, that 426 years after the deluge, when God led Terah and his family out of Chaldea, and Abraham passed over Mesopotamia, Canaan, the kingdom of the Philistines, and Egypt, it does not appear that idolatry had then got any footing in any of those countries: though some idly pretend, that Abraham himself was an idolater.

The first mention we find made of it is in Gen. xxxi. 19, where Rachel is said to have taken the idols of her father: for though the meaning of the Hebrew word therephim, דלתון, be disputed, yet it is pretty evident they were idols. Laban calls them his gods, and Jacob calls them strange gods, and looks on them as abominations. See Therapim.

The species of idolatry by image worship is by many attributed to the age of Eber, 2217 B. C. about 101 years after the deluge, according to the Hebrew chronology; 201 years according to the Samaritan; and 531 years according to the Septuagint: though most of the fathers place it no higher than that of Sereug, which seems to be the more probable opinion, considering that for the first 144 years of Eber's life all mankind dwelt in a body together; during which time it is not reasonable to suppose that idolatry broke in upon them; then some time must be allowed after the dispersion of the several nations, which were but small at the beginning, to increase and settle themselves; so that if idolatry was introduced in Eber's time, it must have been towards the end of his life, and could not well have prevailed so universally, and with that obstinacy, which some authors have imagined. Terah, the father of Abraham, who lived at Ur, in Chaldea, about 2000 years B. C., was unquestionably an idolater; for he is expressly said in Scripture to have served other gods. The eastern authors unanimously agree, that he was a flatterer or carver of idols; and he is represented as the first who made images of clay, pictures having only been in use before; and who taught that they were to be adored as gods. It is said, that he was converted by Abraham. The authors of the Universal History think, that the origin and progress of idolatry is plainly pointed out to us in the account which Moses gives of Laban's and Jacob's parting, Gen. xxxi. 44, &c. From the custom only introduced of erecting monuments in memory of any solemn covenants, the transition was easy into the notion, that some deity took its residence in them, in order to punish the infidels; and this might be soon improved by an ignorant and degenerate world, till not only birds, beasts, flocks, and fowls, but sun, moon, and stars, were called into the fame office; though used, perhaps, at first, by the designing part of mankind, as care-crows, to overawe the ignorant. Univ. Hist. vol. i. part ii. p. 873. edit. fol.

Clavarius, German. Antiq. lib. i. maintains Cain to have been the first idolater; and the false gods that he worshipped to have been the stars, to whom he supposed God had left the government of the lower world; but this is mere conjecture.

Sanchoniathon, who wrote his Phoenician Antiquities, apparently with a view to apologize for idolatry, traces its origin to the descendants of Cain, the elder branch, who began with the worship of the sun, and afterwards added a variety of other methods of idolatrous worship: proceeding to deify the several parts of nature, and men after their death, and even to consecrate the plants shooting out of the earth, which the first men judged to be gods, and worshipped as those that sustained the lives of themselves and of their posterity. Cumb. on Sanch. p. 219. &c.

The Chaldean priests, in processes of time, being by their situation early addicted to celestial observations, instead of conceiving as they ought to have done concerning the omnipotence of the Creator, and mover of the heavenly bodies, fell into the impious error of esteeming them as gods, and the immediate governors of the world, in subordination, however, to the Deity, who was invisible except by his works, and the effects of his power. Concluding that God had created the stars and great luminaries, for the government of the world, partakers with himself and as his ministers, they thought it but just and natural that they should be honoured and extolled, and that it was the will of God they should be magnified and worshipped. Accordingly they erected temples, or places, to the stars, in which they sacrificed and bowed down before them, esteeming them as a kind of mediators between God and man. Impostors afterwards arose, who showed out, that they had received express orders from God himself concerning the manner in which particular heavenly bodies should be represented, and the nature and ceremonies of the worship which was to be paid them. When they proceeded to worship wood, stone, or metal, formed and fashioned by their own hands, they were led to apprehend, that these images had been, in some way or other, animated or informed with a supernatural power by supernatural means; though Dr. Prideaux imagines, that, being at a loss to know how to address themselves to the planets when they were below the horizon, and invisible, they recurred to the use of images. Dr. Prideaux's Connection, &c. book iii. p. 157. 860.

But it will be sufficient to suppose, that they were persuaded that each star or planet was actuated by an intelligence; and that the virtues of the heavenly body were infused into the image that represented it. It is certain, that the fientific nature and divinity of the sun, moon, and stars, was frequently asserted by the philosophers, particularly by Pythagoras and his followers, (D'ogein. Laer. lib. viii. p. 509.) and by the Stoics (Cicero, De Nat. Deor. lib. ii. cap. 15.) as well as believed by the common people, and was indeed the very foundation of the Pagan idolatry. The heavenly bodies were the first deities of all the idolatrous nations, were esteemed eternal, sovereign, and supreme, and distinguished by the title of the natural gods. Thus we find that the primary gods of the heathens in general were Saturn, Jupiter, Mars, Apollo, Mercury, Venus, and Diana; by which we can understand no other than the sun and moon, and the five greatest luminaries next to the sun. Plutarch expressly confesses the Epicureans for asserting that the sun and moon are void of intelligence, whom all men worshipped. Adv. Colot. p. 1123.

Sanchoniathon (apud Enef. Prap. Evan. lib. i. cap. 9.) represents the most ancient nations, particularly the Phoenicians and Egyptians, as acknowledging only the natural gods, the sun, moon, planets, and elements; and Plato declares it as his opinion, that the first Grecians likewise held thee only to be gods, as many of the barbarians in his time did. In Cratyl. p. 273. F. See also Herodot. lib. i. cap. 131. 238. lib. iii. cap. 16. Did Sis. lib. i. p. 10, ii. ed. Rho- dom. Streb. Geogr. lib. xvi. p. 732. Polyb. Hist. lib. vii. p. 699.
IDOLATRY.

Besides these natural gods, the heathens believed, that there were certain spirits who held a middle rank between the gods and men on earth, and carried on all intercourse between them; conveying the addresses of men to the gods, and the divine benefits to men. These spirits were called demons. From this imaginary office ascribed to them, they became the grand objects of the religious hopes and fears of the Pagans, of immediate dependence and divine worship. In the most learned nations, they did not so properly share, as engross the public devotion. To these alone facetious were offered, while the celestial gods were worshipped only with a pure mind, or with hymns and praises. As to the nature of these demons, it has been generally believed, that they were spirits of a higher origin than the human race; and in support of this opinion, it has been alleged, that the supreme deity of the Pagans is called the greatest demon; that demons are described as beings placed between the gods and men; and that demons are expressly distinguished from the beings who were the departed souls of men. A late ingenious writer has, with great acuteness and erudition, combated this opinion, and maintained, on the contrary, that by demons, such as were the more immediate objects of the established worship amongst the ancient nations, particularly the Egyptians, Greeks, and Romans, we are to understand beings of an earthly origin, or such departed human souls as were believed to become demons. This, he says, is a fact attested by all antiquity, whether Pagan, Jewish, or Christian. He appeals to the testimonies of the heathen historians, poets, and philosophers, and to the nature of the worship paid to the heathen deities. He examines the authority of the Old Testament writers; of the authors of the Septuagint version; of Philo and Josephus; of the New Testament; and of the Christian fathers. For a further view of the matter in which this argument is treated, see Farmer on Miracles, chap. iii. § 2. passim. Farmer on Demons, § 2. See Demon and Miracles.

Voltaire, in his art. Idolol. Encyclop. sive, labours to vindicate the heathens in general from the charge of idolatry. He says, that there has not existed any people on earth who affirmed the name of idolaters; and that no such term is found in Homer, or Hesiod, or Herodotus, or any author of the Pagan religion; and that no law was ever enacted, requiring the ultimate worship of idols. The Greeks and Romans, he says, were gentle and polite, but not idolaters; they worshipped the gods by means of these images, and not the images themselves; and were no more chargeable with idolatrous worship than the votaries of the Roman church. He also extends his laboured and spirited vindication to the Persians, Sabians, Egyptians, Tartars, and Turks; and observes, that it is an abuse of terms to call those people idolaters who worship the fun and flares, &c.

Although the Hindoo inhabitants of the East Indies deny the charge of idolatry, using the same description of arguments that are so inconclusively urged by European practitioners of that dangerous species of adoration, in defence of image worship, it is still evident that the maus of the Hindoos are addicted to gross idolatry. Scarcely were the gods of Rome more numerous, certainly less whimsical and monstrous, than their brethren, or perhaps parents, at Benares. It is, however, reasonable to conclude, that among the thinking portion of both cities were many individuals who, contemplating, although unaided by revelation imperfectly, the attributes of the archetype, contemned the artifices by which priestcraft had contrived to direct the worship of their deluded flock, to types and symbols; thus rendering mysterious what is in itself plain, that the initiated alone might profest, the key of the mystery they had invented and taught; be the interwoven medium through which the deity must be propitiated, and themselves divinely seen with awe amid the obscurity of their own creating.

In Moor's Hindoo Pantheon are given exact portraits of many fearful deities worshipped, with appropriate ceremonies, and under various names and titles, by different sects of that grossly superstitious race. Some of these portraits are of images colossal, to a degree perhaps unequaled by any existing statues. (See the article Jaina.) Of others, exceedingly diminutive, some are of metallic casts, but appearing extremely ancient, which exhibit every gradation of art from the rudest imaginative specimen, up to a very respectable portion of skill; and even to elegance of form, and to ease and expression of attitude.

Some writers on the religious or superstitious practices of the East Indians, have relaxed, that certain of their deities must, or may not, be of this or that metal or wood; but admitting that the Hindoos recognize practically the notion that ex quavis is, &c. Major Moor, in his Hindoo Pantheon, proves that the particulars related on that point are erroneous; as he has seen, and indeed gives frequent examples of images made of the very material that, in respect of such individual deity, was said to be unlawful. Another point, too, connected with this subject, he has corrected; for, prior to the publication of the Hindoo Pantheon, and indeed since, it has been asserted that the Hindoos recognize no image of Brahma, the personification of the deity's creative power. (See Brahmans and Siva.) This is not true of Brahma; of him several representations from images are given in that work: but of Brahm, the deity, the one omnipotent, of whose attributes or powers Brahma, Vishnu, and Siva are personifications, no images or representations are extant among the Hindoos. In their scripture, the Veda, (see Veda,) it is declared, that of Him whose glory is so great, there is no image. The word "image" is not, perhaps, in this instance, to be taken in its most confined sense.

This awful reverence of the deity prevails, it may be said, throughout and beyond India, in prevention of any "graven image or likenesses" of him being attempted, and we cannot but think the interdiction grounded on that feeling highly salutary. Among the Mahometans, indeed, the reverential feeling is carried farther, and to an extent not perhaps necessary; for as well as all representation of the person of God, the prohibition extends also to that of the prophet, and no picture or statue of M. homet is in exilie sec.

It is, to return to Hindoo idols, a circumstance very creditable to the exterior morality of that extraordinary people, that no indecent exhibitions are even witnessed in their mythological delineations or sculptures. Major Moor says, (Hin. Pan. page 383,) that among the hundreds, perhaps thousands, of mythological subjects that came under his notice within the last few years of his residence in India, not one was, in any respect, offensive to decency. Such images, he believes, are never seen in India; at any rate they are certainly very rare, or among so many subjects some instance of their existence must have occurred. The Linga and Yoni even, however gross abstractedly, are not indecently represented; their allusions are not obtrusive, but are veiled in mysterious decency, and must, thus happily hidden from the vulgar eye, be extolled by philosophical curiosity. See Linga and Yoni.

The principal causes that have been assigned for idolatry are,
are, the in-dible idea which every man has of God, and the evidence which he gives of it to himself; an in-dible attachment to the fenses, and a habit of judging and deciding by them, and them only; the pride and vanity of the human mind, which is not fatised with simple truth, but mingles and games and dead and falses; the ignorance of antiquity, or of the fifts times, and the fifts men wherein we have but very dark and confused knowledge by tradition, they having left no written monuments or books; the ignorance and change of languages; the style of the oriental writings, which is figurative and poetical, and perfumes every thing; the perufition, froracles, and fears, inspired by religion; the flattery of writers; the falle relations of travellers; the ficions of poets; the imaginations of painters and sculptors; a fmattering of physics, that is, a flight acquaintance with natural bodies and appearances, and their conies; the ettablifhment of colonies, and the invention of arts, made of barbarous people; the artifices of friers; the pride of certain men, who have affected to pass for gods; the love and gratitude borne by the people to certain of their great men and benefactors; and fmally, the Scripture themselves ill understood. One great spring and fountain of all idolatry, in the four quarters of the globe, fays Sir William Jones (Al. Ref. vol. i. p. 436.), was the veneracion paid by men to the fun, or vall body of fire, which "looks from his fole dominion like the god of this world:" and another, the immediate reftpect shewn to the memory of powerful or virtuous ancestors and warriors, of whom the fun and the moon were widely fuppofed to be the parents. See Image.

IDOLKA, in Geography, a town of Lithuania, in the palatinate of Troki; 26 miles S.W. of Troki.

IDOLOPCEIA, Θεολύκεια, in Historia, a specie of propopositions, where different fpecies are fuppoled to fpeak.

IDOLOTHIYA, Θεολόθια, things offered in facrifice to idols; concerning the use of which, the apostle Paul lays down rules in 1 Corinthians, chap. viii. ver. 4, 7, and 10.

IDOLS, Islands of, in Geography, a clufher of small islands in the Atlantic, near the coast of Africa. N. lat. 85°.

IDOMEN,E, in Ancient Geography, a town of Macedon, placed by Ptolemy in Ematia, and repreffed by Heroedes as an ecclesial city.

IDOMENI, in Geography, a town of European Turkey, in the province of Macedonia; 26 miles N.E. of Edefia.

IDRA, a small island in the Adriatic. N. lat. 44° 56'. E. long. 15° 28'.

IDRE, in Geography, a town of Sweden, in Dalvaria; 120 miles N.W. of Falub. See HYDRIA.

IDRIA, See HYDRIA.

IDRIA, Ban of, a district of Carniola, immediately subjed to the chamber of Inner Austria, at Gratz. The quick-fliver mines of Idria are celebrated in natural history, poetry, and romance. They were discovered in the year 1493; and the bill of Vogelberg has annually yielded more than 300,000 pounds weight of mercury. The common ore is chinnabar; but sometimes the pure quick-fliver runs through the croches. Idria is surrounded with woody hills; and the Vogelberg on the E. produces oaks and broom, while the interior confines of red clay, calcareous rock, and a black loft flag, or mud, covers the metallic veins in a southern direction. The deep defert is by ladders and fairs of stone; and the length of the galleries is computed at 516 paces, or 1580 feet. The operations in these vast mule-

IDRIAS, in Ancient Geography, a canton of Pfygia, in the confines of Caria — Allo, a town of Caria.

IDRO, in Geography, a town of Italy, in the department of Mela, on a lake; 16 miles N.N.E. of Drecchia.

IDSTEIN, a town of Germany, in the principality of Nafau-Weilburg; 12 miles N. of Mons. N. lat. 50° 12'. E. long. 8° 12'.

IDGU, a province of Japan, on the S. coast of the island of Niphon.

IDSUME, a town of Japan, in the island of Niphon; 140 miles W.N.W. of Mexico. N. lat. 34° 95'. E. long. 131° 50'.

IDULIA, in Antiquity, certain eggs offered to Jupiter on the ides of every month. They were so called from their being offered on the ides.

IDUMAEA, in Ancient Geography, or Land of Edom, a country of Asia, on the confines of Palestine and Arabia, or rather comprehending parts of Palestine and Arabia; having Judea on the N., Egypt, and a branch of the Red Sea on the W., the rest of Arabia Petraea on the S., and the desert of Arabia on the E. Its extent varied in different periods of time. Esau, or Edom, from whom it derived its name, and his descendants, setled along the mountains of Sin on the E. and S. of the Dead Sea, from whence they spread themselves by degrees through the W. part of Arabia Petraea, from that sea quite to the Mediterranean. (See EDOM.) In the time of Moses, Joshua, and even of the Jewish kings, they were hemmed in by the Dead Sea on one side, and the Ebenezer gulf on the other; but during the Jewish captivity at Babylon, they advanced further N. into Judea, and spread themselves as far as Herbron in the tribe of Judah, taking possession of what had formerly been the whole inheritance of the tribe of Simeon, and half of that which had been the inheritance of the tribe of Judah, until at length going over to the religion of the Jews they became incorporated with them into the same nation. Josephus gives this account of their conversion. Hyrcanus took also Adora and Maridia, cities of Idumaea; and having subdued all the Idumceans, he permitted them to remain in the country, upon condition that they would be circumcised and use the Jewish laws, and submit to live in every respect as Jews. From that time, in the 129th year B.C., they became Jews. Strabo, and after him many later geographers, had divided it into Eastern and Southern Idumaea, with regard to its situation from Palestine. The capital of the former was called "Bozrah" or "Bostra," and of the latter "Perea," or "Jebel Amal." Josephus, with regard to its extent, at different periods, distinguishes it, when at the longest, by the epithet of "Great," in opposition to its more narrow boundaries, and places Herbron among the Idumcean cities. He seems also to distinguish between Lower and Upper Idumaea; but, upon the whole, the country is represented as hot, dry, mountainous, and in some parts barren; the mountains exhibiting dreadful rocks and caverns, like the southern part of Judah, which is called a desert, full of such rocky recesses and caverns, which became the lurking-places of thieves and banditti. Concerning its ancient history, see the article EDOM.

Of this country little has been said by modern geographers and travellers, except that it lies mostly waste and uncultivated. It is inhabited by wild Arabs, with whom Europeans have little or no intercourse. The country is now in possession of the Turks; though it doth not appear that they keep any Garrisons in it, except on the sea-coast, for securing the road between Egypt and Palestine. Among the cities mentioned by travellers is Larish, to which we may add Salka, near the frontier of Egypt, the residence of the
The Turks keep soldiers also at Tina, a town on the sea-shore; Catio, a garrisoned castle, where a toll is exacted from all merchants and passengers, situated in a defect; Tor, a small sea-port and castle near the straits of Suez, where an aga commands the garrison.

**IDYLLION**, in *Poetry*, a little poem, containing the description or narration of some adventures.

The word is derived from the Greek ἰδύλλιον, diminutive of ἰδύλλιον, *idiollion*; because this poetry consists in a lively natural image or representation of things.

The learned Bishop Lowth, in his *Prælectiones, &c.* defines an idyllion to be "a poem of moderate length, of an uniform, middle style, chiefly distinguished for elegance and sweetness; regular and clear as to plot, conduct, and arrangement.

Theocritus is the oldest author who has written idyllions. The Italians imitate him, and have brought the idyllion into modern use.

The idyllions of Theocritus have a peculiar delicacy; they appear with a clowns, rustic kind of simplicity, but are full of the most exquisite beauties; they seem drawn from the breath of nature herself, and to have been dictated by the graces.

The idyllion is a kind of poetry which paints the objects it describes; whereas the epic poem relates them, and the dramatic acts them. The modern writers of idyllions do not keep up to that original simplicity observed by Theocritus; the people of our days would not bear an amorous fiction, resembling the awkward gallantries of our peasants. Boileau observes, that the shortest idyllions are usually the belt.

The modern idyllions differ from those of the ancients, by introducing none but allegorical shepherds or courtiers disguised in their dress; whereas those of the ancients represent true shepherds. Mr. Hardison observes, that the taste of the present age is so very different from that of the ancients in this respect, that he would not take upon him to give a literal translation of Theocritus's idyllions; not that he reckons them bad in themselves, nor that he condemns the rules followed in their composition; but because the rules that were good at the time those poems were written, would, in the present age, be relished but very few.

The subject of idyllions, as being low of itself, requires the greatest elegance of diction to set it off. Mr. Hardison is of opinion, that Theocritus has the advantage of Virgil in this respect; observing always the structure peculiar to pastoral poems, which constitutes one of its chief beauties. This structure requires that the fourth foot of every verse should be a dactylus, and sometimes also the first, when it can be done without affectation. Besides, it is also necessary that these dactyls should be made without any exclamation; and, if possible, there should be a reft in the sense after each dactylus, which would add greatly to the regularity and perfection of each verse. Such are the following veres of Theocritus and Virgil:

*EXR XEIOI, a KOPÉ, THEIOV AESIO ΠΡΟΦΑΝΕΑ.*

*Die mihi, Damaz, cujum pecus? An Melibae?*

Virg. Eel. iii. ver. 1.

This structure in pastoral poems gives a vivacity, which is wonderfully pleasing in the mouth of a shepherd. These rules are observed by Theocritus with all the exactness possible; but by Virgil seldom; which is rather to be imputed to the genius of the Latin tongue than his want of ability; it being less copious, bold, and plaint, than the Greek.

The invention of the idyllion is ascribed to Daphnis, who, by his extraordinary genius, says Diodorus Siculus, "introduced the bucolic poem and song, in the form it continues to appear in at present in Sicily." This passage is considerable, as it fully ascertains the origin of the idyllion, such as it appears in Theocritus, and those that have imitated him.

After Daphnis, another Sicilian shepherd, called Dionysus, made himself famous for his pastoral poems. Next came Stichorchos, who, according to Aelian, was the first that made the misfortunes of Daphnis the subject of his songs. He lived, as some chronologers will have it, in the time of Phalaris, about 550 years before the vulgar era; and lastly, some ages after this Theocritus appeared, who, forming himself on these first models, so far excelled as to give pastoral poetry all the perfection it was capable of receiving. Mem. Acad. Inscript. tom. i. p. 107.

Bishop Lowth, already cited, produced from the writings of the Hebrews many perfect examples of this kind of poem. The first of those poems which deserve notice are the historical psalms, in celebration of the power and other attributes of the Deity, manifested in the miracles which he performed in favour of his people. One of the principal of these occurs in the 78th psalm; the style which is simple and uniform, but the structure is poetical, and the sentiments occasionally splendid. Of a similar kind are the 105th and 106th psalms, which much resemble the 78th, as well in the subject as in the style. The mixture of canto and grace, displayed in the exordium, is the same in all. These psalms, both in plot and conduct, bear a surprising analogy to the hymns of the Greeks; a species of poetry which was in very early life among them, and almost entirely appropriated to the celebration of their religious rites. The subjects in general were the origin of the gods, the places of their birth, their achievements, and the other circumstances of their history. Such are all the poems of this kind now extant in the Greek; such are the elegant hymns of Callimachus, as well as those which are attributed to Homer. The poem of Theocritus, entitled the "Diocons," or the praise of Callor and Pollux, is also a genuine hymn, and very elegant in its kind; nor is it improperly classed among the Idyllions, which include all of this species. The 130th psalm may be referred to the class of those of the historical kind. The exordium commences with this well known ditich:

"Glorify Jehovah, for he is good;
For his mercy endureth for ever;"

which, according to Ezra (iii. 10, 11.), was commonly sung by alternate choirs. Here the latter line of the ditich, being added by the second choir, and subjoined to every verse (which is a singular cafe), forms a perpetual Epode. Hence we may collect the whole nature and form of the intercalary verse, or burthen of the song; which expresses in a clear, concise, and simple manner some particular sentiment, that seems to include virtually the general subject or design of the poem; and it is thrown in, at proper intervals, according to the nature and arrangement of it, for the sake of impressing the subject more firmly upon the mind. That the intercalary verse is perfectly congenial to the Idyllium, is evident from the authority of Theocritus, Bion, Molchus, and even of Virgil. The 150th psalm may be undoubtedly enumerated among the elegant monuments of antiquity; and it is chiefly indebted for its elegance to the general plan and conduct of the poem. Another example might
might be selected from Isaiah; for by uniting the conclusion of the ninth chapter with the beginning of the tenth, ingeniously separated by the common division into chapters, we shall find a complete and connected prophecy against the kingdom of Israel or Samaria. (Is. x. 5.) It is replete with terror and solemnity, and poetically a degree of force and solemnity to which the Isidlium seldom rises; though it preserves the form of the Isidlium so perfect and expressive, that it cannot with propriety be referred to any other class. Besides the influences already mentioned there are others, and probably not a few (in the book of Psalms particularly), which may be equally accounted of the Isidlium species. To this class belong especially those in which some particular subject is treated in a more copious and regular manner than is usual in compositions strictly lyric. Such is the 14th Psalm, in which the poet embellishes his noble subject with the clearest and most splendid colouring of language; and with imagery the most magnificent, lively, diversified, and pleasing, at the same time select, and happily adapted to the subject. Nothing, says our learned author, of the kind extant, can be conceived more perfect than this hymn, whether we consider it with respect to the contrivance beautiful, or as a model of the species of composition. The Greek hymns, I believe, are chiefly of fables; and these fables regarded persons and events, which were neither laudable in themselves nor greatly to be admired; "indeed," says the ingenious prelate, "I do not recollect any that are extant of this sublime nature, except that of the famous ficus Cleanthus, which is inscribed to Jove, that is, to God the Creator, or, as he expresses himself, "to the Eternal Mind, the Creator and Governor of nature." It is doubtless a most noble monument of ancient wisdom, and replete with truths not less solid than magnificent.

The hymn of David, just mentioned, deservedly occupies the first place in this class of poems; and that which comes the nearest to it, as well in the conduct of the poem as in the beauty of the style, is the 139th Psalm, which, though perhaps excelled by the former in the plan, disposition, and arrangement of the matter, is not in the least inferior in the dignify and elegance of the figures and imagery.

IDYMA, or IDYMS, in Ancient Geography, a town and also a river of Asia Minor, in Caria; called Idimus by Ptolemy.

IDYRUS, a town and river of Asia, in Pamphylia.

JEACOCK, Samuel, in Biography, brother to the celebrated president of the Robin-Hood society, was by trade a baker, and carried his loaves to his customers on his own shoulders. He would not have been mentioned here among musical dilettanti merely for being fond of music, but for a peculiar talent of which we have never known any other person possessed. This worthy tradesman played a little on several instruments, but chiefly the tenor; and at the Madrigal society, established in his time, he used to sing the bale part. He was an excellent judge of instruments played with the bow; their strings, tone, and construction; found out their defects, and often cured them. He was one of the best ringers and swimmers of his time; and even when in years, was very expert in other manly exercices. But his most extraordinary talent was the being able, without knowing the names of the keys of the harpsichord, to play upon it, with his 10 fingers, without the least hesitation, any number of changes in a peal of 10 bells, which changes amounted to 3,628,800. After facing as well as hearing this astonishing performance on our own instrument, we tried to express, in musical notation, the changes in favourite peals on eight or ten bells, but were totally unable to play them even with the notes before us, or to meet, among the greatest performers on the harpsichord, with any one that could. The melodies produced by these changes are so wild and unlike anything to which the hand or the eye is accustomed, that they are as difficult to a confounded matter, as the first tune to a child who has just learned the gamut. See BELLS and CHANGES.

JEALOUSY, in Ethics, is that peculiar uneasiness which arises from the fear that some rival may rob us of the affections of one whom we greatly love, or suspicion that he has already done it. The first sort of jealousy is inseparable from love, before it is in possession of its object, and the latter is often unjust, generally mischievous, always troublesome.

JEALOUSY, Waters of. See WATERS.

JEAN, St., in Geography, an island of Swierland, in Bienne lake.—Alfo, a town of Canada, on the left bank of St. Lawrence. N. lat. 46° 39'. W. long. 71° 33'.—Alfo, a town of Canada, on the right bank of St. Lawrence. N. lat. 47° 12'. W. long. 70° 12'.

JEAN d'Angely, St., a town of France, and principal place of a district, in the department of the Lower Charente. The place contains 54,036, and the canton 13,527 inhabitants, on a territory of 222.5 kilometres, in 20 communes. The chief article of trade in this place is brandy, and it has a manufacture of woollen stuffs. N. lat. 45° 59'. W. long. 0° 15'.

JEAN d'Aulph, St., a town of France, in the department of the Loman, and chief place of a canton, in the district of Thionon. The place contains 1918, and the canton 6344 inhabitants, on a territory of 187.3 kilometres, in 6 communes.

JEAN de Bouromy, St., a town of France, in the department of the Ilôre, and chief place of a canton, in the district of Vienne; 12 miles E. of Vienne. The place contains 2848, and the canton 11,773 inhabitants, on a territory of 237.3 kilometres, in 14 communes.

JEAN de Brewley, St., a town of France, in the department of Morbihan, and chief place of a canton, in the district of Ploermel. The place contains 2773, and the canton 11,577 inhabitants, on a territory of 261.3 kilometres, in 7 communes.

JEAN de Daye, a town of France, in the department of the Channel, and chief place of a canton, in the district of St. Lô. The place contains 124, and the canton 8197 inhabitants, on a territory of 132.4 kilometres, in 17 communes.

JEAN du Gard, a town of France, in the department of the Gard, and chief place of a canton, in the district of Alais. The place contains 3223, and the canton 5101 inhabitants, on a territory of 87.1 kilometres, in 3 communes.

JEAN de Ligne, a town of France, and principal place of a district, in the department of the Côte d'Or, 15 miles S.E. of Dijon. N. lat. 47° 5'. E. long. 5° 19'.

JEAN de Lour, St., a sea-port town of France, in the department of the Lower Pyrenees, and chief place of a canton, in the district of Bayonne, situated in the bay of Biscay; the harbour of which has lately been improved; 10 miles S.W. of Bayonne. The place contains 25,375, and the canton 8457 inhabitants, on a territory of 115.5 kilometres, in 9 communes. N. lat. 43° 35'. W. long. 1° 35'.

JEAN de Maiseranc, St., a town of France, and chief place of a district, in the department of Mont Blanc, lately capital of a county in Savoy, and the seat of a bishop, near the union of the rivers Arve and Aral; besides the cathedral it has two parish churches and a convent; 27 miles S.E. of Champery. The place contains 2258, and the cantons 4 M. 17.50.

Lower Pyrénées, and chief place of a canton, in the district of

Marlène, having a castrum on a rock, at the entrance of one of the passages of the

Pyrénées; 12 miles S.E. of Bayonne. The place contains 1286, and the
canton 8205 inhabitants, on a territory of 417 $^3$ kilometres, in 20 communes. N. lat. 43°' 9'. W. long. 1° 10'.

JEAN en Royans, a town of France, in the department of the

Drôme, and chief place of a canton, in the district of

Valence; 18 miles E.N.E. of Valence. The place contains 2828, and the canton 6791 inhabitants, on a territory of 232 $^3$ kilometres, in 16 communes.

JEAN de Solignieu, St., a town of France, in the department of the

Lyon, and chief place of a canton, in the district of Montrifon; 7 miles S. of Montrifon. The place contains 574, and the canton 7954 inhabitants, on a territory of 180 kilometres, in 16 communes.

JEAN de Vergi, St., a town of France, in the department of the

Dordogne, and chief place of a canton, in the district of

Périgueux. The place contains 786, and the canton 6008 inhabitants, on a territory of 277 $^3$ kilometres, in 18 communes.

JEAN de Ferrières, St., a town of France, in the department of the

Aisne; 24 miles S.S.E. of Grenoble.

JEAN-CAPELLE, in Jedebology, a name given by

Ruyfch, and some others, to the fish called by the authors of the

Jedebology, or Indian dore; and more expressively named

by Artdi the zeus with a forked tail.

JEAN-DE-BARRE, in Geography, an island of Africa,

in the kingdom of Senegal, about 15 miles in circumference.

JEANNIN, Peter, in Biography, was born in 1540,

and brought up to the profession of the law. He was, at an early age, appointed advocate in the parliament of

Burgundy, and soon distinguished himself by his eloquence and

force of reasoning. He was afterwards appointed agent for

the affairs of the province. In this situation he nobly refuted,

with all his power, the order for perpetrating, at Dijon, the

massacre of the Protestants on St. Bartholomew's day, which

took place in Paris and other cities. This was particularly

meritorious in him who was a most zealous Catholic, so

much so that he joined the leaguers in support of their

religion; a circumstance which proved highly serviceable to

the kingdom; for, being deputed by the duke of Mayenne
to negotiate with Philip of Spain, the declared protector of the

league, he soon discovered that the real design of that prince,

in supporting the civil war in France, was to gain possession

of some of his best provinces. On his return, therefore, he

exerted himself to detach the duke from the Spaniards, and
to acknowledge his lawful sovereign. Henry IV. made him

a member of his council, and kept him at his court, where

nothing was undertaken without his advice. He died at the

age of 82, in the year 1622. This respectable man witnessed the

tumults of seven kings to the throne of France. His

Memoirs and Negotiations were published, in 1659, at Paris, in

folio; but they have since been printed in four volumes

12mo. They are regarded as excellent guides for the

management of important and difficult concerns. Morei.

JEAN-RABET, in Geography, a town of the island of

Hispaniola, at the mouth of a river on the N.W. coast; 10

miles N.E. of St. Nicholas Mole. N. lat. 19° 56'. W. long.

47°.
John, John, an eminent scholar, divine, and physician, was the eldest son of the Rev. John Jebb, dean of Cathed, sprang from a family in Nottinghamshire, and was born at Loughborough, in Leicestershire, in 1735. Having finished his early education at several schools in England and Ireland, he was admitted a pensioner of Trinity-college, Dublin, in 1753, and in the following year entered at St. Peter's college, Cambridge, where, in 1757, he took the degree of B.A., and commenced the office of private tutor. In 1760 he proceeded to the degree of M.A. and was confirmed fellow. In 1762 he received deacon's orders, and in the following year those of priest. He was elected to the rectory of Ovington, in Norfolk, in 1764, and in the same year married Ann, daughter of the Rev. J. Torkington and of lady Dorothy Sherrard, with whom he lived in happy union of sentiment and affection to the time of his death. In 1767 he published, in conjunction with two friends, viz. the Rev. Roger Thorpe and the Rev. George Woolston, a work held in high estimation at Cambridge and elsewhere, and entitled "Excerpta quaedam et Newtoni Principis Philosophiae Naturalis, cum notis Variarum," 4to. On the return of our author to Cambridge in 1766, he commenced an important era of his life. Refining his office as private tutor, and reading occasional lectures, he entered with ardor into the concerns of the university. In 1768 he began a course of lectures on the Greek Testament, in the prosecution of which he avowed opinions of a very liberal kind; and in his political sentiments he ranked himself among the advocates for popular measures. In both these respects he became the undistinguish and zealous advocate of reformation both in church and state. Having in 1767 been presented to the vicarage of Flinton, near Bungay, and to the united rectories of Homersfield and St. Crofs, and being also nominated chaplain to his wife's relation, the Earl of Harborough, he from this time divided his residence for some years between Bungay and Cambridge. In 1770 he published a "Short Account" of his theological lectures, which had subjected him to some obloquy, and in 1772 he re-edited this "Account" with large additions. About this time he took an active part with those who sought relief in the matter of ecclesiastical subcription, and appeared as an advocate of the cause in the Whitfield Evening Pulpit, under the assumed appellation of "Paulinus." His letters were collected in a pamphlet, published in 1772. He was also instrumental for the improvement of academical education at Cambridge; with a view to which he wished to establish annual examinations. But all his liberal efforts and plans proved ineffectual with regard to their main object, although it has been thought that they were not altogether fruitless as to their general influence on the state of the university. Soon after this time, Mr. Jebb, actuated by an integrity and zeal which did him great honour, determined to withdraw from the public service of a church, the established doctrines of which he disapproved; and accordingly in September 1777, he resigned all his livings, and in September 1776, he finally left Cambridge. He was now entering age, as it were, into life; and with a view to an honourable and useful mode of exercising his talents and of procuring a subsistence, he determined, under the advice of his friend the Rev. Richard Jebb, to assume the medical profession. The necessary qualifications it would not require much time to attain, when we consider the comprehensive mind and the indefatigable industry of Mr. Jebb; and therefore after devoting his attention for some time to the studies connected with the profession which he had in view, he obtained in 1777 a diploma of M.D. from St. Andrews, and was admitted a licentiate of the London college, and commenced practice in February 1778, pursuing at the same time various means of medical improvement. In this year he was elected a fellow of the Royal Society. In his political career he connected himself with those who were adverse to the American war; and he was always ardent in every cause which he deemed of importance, his zeal on this occasion obstructed his professional success, though he had many friends who thought highly of his talents, and who much wished to serve him. Of his attention to the duties of his profession he gave evidence to the public in 1752 by a work entitled "Select Cafes of the Disorder commonly termed the Paralysis of the Lower Extremities; to which is added A Cafe of Catalepsy." These cases tend to support the practice of Mr. Pott in applying cauteries to the tumour of the spine in the above-mentioned paralysis. The ardour of Dr. Jebb's mind, the affability of his application, the various anxieties he felt for the interests of the public, and the fatigues which he underwent in his endeavors to promote them, impaired his bodily health and strength, and reduced him to a state of debility, under the progress of which he sunk, whilst he retained the full exercise of his faculties and benevolent feelings; so that he terminated a course of honourable and active service on March 2, 1786, in the 51st year of his age. His works consist of his "Phaen of Theological Lectures;" "A Harmony of the Gospels;" letters on the subject of subscription; sermons and theological tracts; papers relative to the state of public education at Cambridge; of medical cases; and of political and miscellaneous papers. They were collected and published in three large volumes 8vo, in 1797 by Dr. John D'Israeli, who has prefixed memoirs of his life, to which we are indebted for the preceding article.

JEBHAN, in Geography, a town of Hindoostan, in Lahore; 55 miles N. N.E. of Bahmurr.

JED, in Geography, a town of S. 15' N. lat. 16° 15'. E. long. 125° 33'.

JEBUS, in Ancient Geography, an ancient name of Jerusalem; before it was conquered by the Israelites. It was so called from its founder Jebus, son of Canaan, and father of the Jebusites. Josh. xvii. 10. Judg. xix. 11.

JECARINUS PISCES, in Ichthyology, a name given to Ganes, and many other writers, to the fish more commonly called haepatus pescis, by some jecfus marinus.

JECERAHEL, in Ancient Geography, a name given to Petra, the capital of Arabia Petraea; said to have been derived from the name of a rock, from the summit of which Amaziah, king of Judah, precipitated 2500 Idumceans whom he had taken in battle.

JECUR. See Liver.

Jecus marinus, in Ichthyology, is used by Hermolaus and some other writers in the same sense with hepatus marinus.

Jecur urinae. The placenta is by some thus called, from the supposed resemblance of its figure and office with that of the liver.

JEDBURGH, anciently called Jedworth, in Geography, a royal borough, and capital town of the county of Roxburgh in Scotland, is pleasantly situated on the banks of the river Jed, and is nearly surrounded with lofty eminences. The town lays claim to remote antiquity. The two Jedburghs, or Jedworths, according to Chalmers, are the oldest parishes in Scotland. As early as the middle of the tenth century, bishop Edward founded a church and village at
on the banks of the Jed, at or near this place. At the commencement of the Scoio-Saxon period a castle was standing here, and the village was advanced to the dignity of a burgh, under the influence of the baron. Malcolm IV. is said to have reside very frequently at this castle, and finished his youthful career at this place in the year 1165. In several charters granted by this monarch, by William and Alexander II., Jedburgh is called "Our Burgh." Other monarchs, and nobles of the first rank, made the castle of Jedburgh a place of residence, and many public acts were executed here; and after the demise of Alexander III. the town, monastery, and castle were involved, for several ages, in bloodshed and devastation. Hamilton, an amiable poet, thus laments the effects of wars, on

"Jedas ancient walls, once seat of kings."

In 1147, David I. founded a monastery for canons regular at this place, and provided it with ample revenues arising from tithe, "the multure of the mill of Jedworth," and a saltwork. Malcolm IV. augmented these revenues. The bishop of Glasgow, and the abbot of Jedburgh, had many alterations respecting their dignities, liberties, cullums, rents, &c. and at length the former obtained a decided ascendency over the latter. The wars between the Scots, and king Edward I. of England, involved the abbot and his canons in ruin. They were driven from their monastery, and fought refuge in different religious houses in England. At the Reformation, the monastery became the property of the king by negotiation. A convent of Carmelites was founded here in 1513. Befides the town of Jedburgh, the parish comprehend a large district, which is divided into three parts by the intervention of the parishes of Abbot-rule and Oxnam. The lower division, on both sides of the river, forms the principal part of the parish; the second contains the district of old Jedburgh; and the third, or upper part, lying on the east side of the river, and extending to the border mountains, constitutes the barony of Edgarstown. Befides the established church, the town contains three other places of worship; respectively called the Burger-meeting, anti-Burger-meeting, and Relief congregation. Jedburgh is governed by a provost and three bailies, affiiled by a select council of the principal inhabitants. Here are a weekly market, and several fairs. The vicinity of the town is noted for its orchards. In 1800 the number of houses was 676, and of inhabitants 3834. Clair's Caledonia, vii. 382. Sinclair's Statistical Account of Scotland, vol. i. JEDNITZA, a town of Hungary, on the borders of Moravia; 30 miles N. of Topoltzan.

JEDO, Joppo, or Tedo, the capital of Japan, centrially situated on a bay of the same name, on the S.E. side of the chief island Nippon. The houfe never exceed two stories, and have numerous shops towards the streets. The harbour is so shallow, that an European ship would be obliged to anchor at the distance of five leagues. The city towards the bay forms the figure of a crescent, and is of such extent, as the Japaneze affirm, that it would occupy a period 21 hours to walk round its circumference, which might thus amount to 21 leagues: and they say, that it is seven leagues in length by five in breadth. Thunberg observes, that it is said to be 63 British miles in circumference, and at any rate rivals Pekin in size. A large river, not named by Kämpfer, but by others called Toikag, passes through the city, and discharges itself into the haven by five streams, over each of which is a bridge: a considerable branch surrounds the castle, and fills its ditches, over which is the principal bridge, called Niphonbas, which is the centre whence roads and dillances are measured. These streams supply several canals. The bridge now mentioned opens on both sides into a long street, 50 paces wide, that traverses the whole city, and that is thronged with passengers, many of whom are richly dressed, and carried in their chairs and palanquins. This city has suffered much from repeated earthquakes, and also from a fire, which, in 1772, is said to have consumed four leagues of it in length, and three in breadth. Since these calamities have occurred the buildings have been improved, the streets have been widened and made to cross one another at right angles, and several palaces, temples, monasteries, and public edifices have been erected in a more beautiful style. The most superb structure is the emperor's palace, which is surrounded by stone walls and ditches with draw bridges, forming of itself a considerable town, which is said to be five leagues in circumference. It contains of three inclusures, the innermost of which is the residence of the emperor, and behind it are magnificent gardens, and the other two are occupied by the princes and lords that compose his court. The police of the town is under the conduct of two governors, who act alternately for a year; and besides, there are several subordinate magistrates, who superintend the streets, the tradesmen, handicrafts, &c., who are very numerous, and of various descriptions. Like other Japanese cities, Jedo has neither walls nor fortifications; but it includes a great number of shops and markets, furnished with all sorts of necessaries and merchandise, which are sold at a higher price than in any other city of the empire, on account of the population of the place, and the difficulty of importation. N. lat. 36° 35' E. long. 140°.

JEEMWOREE, a town of Hindooftan, in Oude; 40 miles E. of Fyzabad.

JEER-CAPTAIN, in Nautical Language. See CAPTAIN.

JEERS, or JEARS, in a Ship, an assemblage of tackles, by which the lower yards of a ship are hoisted up along the masts to their usual position, or lowered from thence as occasion requires; the former of which operations is called *laying,* and the latter *furling.*

In a ship of war the jeers are usually composed of two strong tackles, each of which has two blocks, viz. one fastened to the lower mast-head, and the other to the middle of the yard. The two blocks which are lashed to the middle, or slings of the yard, are retained in this situation by means of two cleats, nailed on each side, whose arms enclose the ropes by which the blocks are fastened to the yard. The two ropes which communicate with these tackles lead down to the deck on the opposite side of the mast, according to the situation of the upper *per-blocks.* The jeers in merchant-ships have usually two large single blocks on the opposite side of the mast-head, and another of the same size in the middle of the yard. The rope, which communicates with these, passes through one of the blocks hanging at the mast-head, then through the block on the yard, and afterwards through the other hanging-block upon the mast. To the lower ends of this rope, on the opposite sides of the mast, are fixed two tackles, each of which is formed of two double blocks, the lower one being hooked to a ring-bolt in the deck, and the upper one spliced or seizing into the lower end of the great rope above, which is called the
JEFFERIES, George, in Biography, an English judge, whose name has already been mentioned in some foregoing articles with becoming indignation, was born at Acton in Denbighshire, and educated at Welfirmill school, after which he removed to the Inner Temple, where he studied the law with great application. By attaching himself to the duke of York (see James II.) he obtained the place of a Welsh judge, the honour of knighthood, and the chief-judicature of Chester. In 1693 he was appointed chief-justice of the king's bench, and in 1685 lord chancellor. His cruelties on the western-circuit upon the followers of the duke of Monmouth were of the most savage kind: they were, however, quite satisfactory to the king, who merrily (a wretched subject for royal merriment) denominated this particular circuit "Jefferies's campaign." By supporting all the arbitrary meaûres of the court, he rendered himself fo obnoxious to the people, that when James abdicated the throne and fled from the kingdom, he would gladly have followed his master, but being detected in the disguise of a tailor, he was seized, and without being tried to pieces by the people, had he not been rescued by the civil power; he was afterwards committed to the Tower, where he died in 1689. Hume's Hist.

JEFFERSON, in Geography, a county of Kentucky, in America, bounded N. and W. by Ohio river, S. by Nelson county, and E. and S. by Shelby; it contains 8395 inhabitants, of whom 2330 are slaves. The chief town is Louisville.—Also, a county of Georgia, formed in 1795 from the counties of Burke and Warren, bordering on Ogeechee river, and Brid and Big creeks. It contains 5684 inhabitants.—Also, a county in Tenessie, Hamilton district, watered by several rivers, and containing, together with the county of Coeke, 9017 inhabitants, of whom 695 are slaves.—Alfo, a county of the state of Ohio, bounded S. by the Ohio, and N. by the lake Erie, including the tract called the Connecticut reserve; and containing 8766 inhabitants. Its chief town is Stubbenville.—Alfo, a part-town of Virginia, on the N. side of Roanoke river, 19 miles below the Oconeeh theilans. N. lat. 36° 32'.—Alfo, a town in Crafton county, North Carolina, containing 112 inhabitants.—Alfo, a town of Pennsylvania, nine miles from Amity, and seven from Scottsville.—Alfo, a fort in the state of Ohio, situated on a small stream, which falls into the Great Miami, containing about 100 men; 21 miles N. of fort St. Clair. N. lat. 40° 4'.—Alfo, a town on the E. bank of the Mississippi, in Kentucky, near the line of the state of Tenessie.

JEFFERY, Thomas, in Biography, son of a respectable merchant, was born at Exeter towards the close of the seventeenth century. He received his academical education in the seminary under the care of Mr. Joseph Hallet; in connection with whom he afterwards, for some time, preached. In the year 1726 he settled at Little Baddow, in Essex, where he remained but two years, when he returned to his native city. He had already exhibited talents which led his friends to expect much from his future labours, but Death, who pays no regard to superior abilities, took him away while he was still a very young man. His publications, which were chiefly in defence of our common religion, met with the approbation of the wife and the learned, and even extorted his admirers from his principal antagonist Mr. Anthony Collins. His principal pieces are entitled "The Tree Grounds and Reasons of the Christian Religion, in opposition to the false Ones, &c.;" "Christianity: the Perfection of all Religion, Natural and Revealed, &c." Mr. Jeffery possessed a strong intellect; he devoted himself to the investigation of the feriptures: so absorbed was he in application and thought, that he would go a whole day without his usual meals, and without recollecting that abstinence to which were owing the languor and exalted spirits which he felt in the evening. He had an expanded, liberal, and candid mind. Dr. Kennicott highly applauded Mr. Jeffery's answers to Collins; and Dr. Doddridge deprecates the writer as having treated the subject of prophecy, and the application of it in the New Testament, more studiously, perhaps, than any one since the time when Ezechias wrote his "Demonstratio Evangelica." Monthly Mag.

JEFFERY'S, a river of South Carolina, which runs into the Great Pee dee. N. lat. 34° 8'. W. long. 79° 29'.

JEFFERYS, George, in Biography, was born at Weldon, in Northamptonshire, and educated at Welfirmill school, and Trinity college, Cambridge, where he obtained a fellowship. He afterwards finished the law as his future profession, but never practised in it. He died in 1755, at the age of 57; he had in the preceding year published his works in a collective form in one volume quarto, containing miscellanies in prose and verse, and among other pieces, the tragedies of Edwin and Merope.

JEFFREY'S LODGE, in Geography, a sand-bank on the coast of Maffachusets, between cape Ann and Caneo bay, extending from the N. W. to the S.E.; between 43° 40' and 47° 37' 30" N. lat. and between 68° 52' 30" and 69° 45' W. long.

JEGUN, a town of France, in the department of the Gers, and chief place of a canton, in the district of Auch; 13 miles E. of Condom. N. lat. 43° 45'. E. long. o° 32'.
JEHAGH.  

JEHANABAD, in Geography, a town of Hindoostan, in Bahar. N. lat. 25° 31'. E. long. 83° 58'.

JEHAOUL, a town of Hindoostan, in Moulain; 15 miles W.N.W. of Adjoin.

JEHENABAD, a town of Hindoostan, in Bahar; 20 miles S.S.W. of Patna. N. lat. 25° 12'. E. long. 15° 11'.

JEHOVAH, in Theology, one of the scriptural names of God; signifying the Being who is self-existent, and who gives existence to others. (See God.) When God declared to Mose, that he had not made known his name Jehovah, he does not mean that they were ignorant of him, as God the creator, self-existing; but that he had not revealed this name, which so well expresses his nature, and by which he would be invoked afterwards.

So great a generation had the Jews for this name, that after the Babylonish captivity they left off the custom of pronouncing it; whereby its true pronunciation was forgotten. They call it tetragrammata, or the name with four letters; and believe that whoever knows the true pronunciation of it, cannot fail to be heard by God. Simon the Just, they say, was the last who was acquainted with it. The author of the Talmud denounces terrible curses against those who pronounce it; they scruple even trying to do it; and pretend that the angels have not this liberty. But it would be endless, and no less unprofitable, to recite the various whims and fancies which the Jews, the Calahills, and the Mahometans have indulged with regard to this name, and that of Allah, corresponding to it among the latter. See Adonai.

JEJURRA, in Geography, a town of Hindoostan, in Bahar; 18 miles N.W. of Durbangah. N. lat. 26° 19'. E. long. 87° 50'.

JEJUNE STYLE. See Style.

JEJUNUM, the second of the small guts; thus called from the Latin jejunus, hungry; because always found empty. See Intestines.

JEJURRY, in Geography, a town of Hindoostan, in the country of Vifapour; 12 miles E. of Poorundar.

JEJURY, a town in the East Indies, near which is an elegant temple, of considerable celebrity among the Hindoos. It is that described by Major Moor in his Hindoo Pantheon. A handsome temple, dedicated to the worship of an avatar of Siva under the name of Kandeh Rao, (see Kandeh Rao) is at Jejery, a town of some extent, about thirty miles to the S.E. of Poonah. I have visited this temple. It is situated in a beautiful country, on a high unconnected hill, and has a very commanding and majestic appearance: the temple, surrounding walls, and steps up to it, are well built of fine stone. I have had occasion to remark, and it has also doubtless been remarked by others, that the sites of churches built by the Jesuits are always on the most healthful, beautiful, and picturesque points, evincing the judgment and taste of that wonderful order of men: the same may, I think, be observed of Hindoo temples; generally, after allowing for the necessary proximity of water, the most beautiful the neighbourhood affords.

"The obtrusive importunity of the beggars prevented me from examining this fine temple at Jejery so fully as I wished; indeed, from their officiousness I could scarcely examine it at all. The Brahmins informed me, on subsequent enquiries, that a temple is there, about two feet square, on which are two Lingas (see Linga) one larger than the other, whence Kandeh Rao, and I suppose Malsara, his comfort, (see Malsara) sprung: there are the two images of him, one of gold, one of silver, and one of silver of Malsara; all richly ornamented on great days, when they are mounted on horseback or on elephants. If, however, there really be such massive images in metal, they could scarcely be carried by a horse. Images of lighter materials are, I apprehend, sublimated; or, metallic heads are embossed, armed and arrayed with clothes; and thus carried about or exhibited. I have several of these hollow heads, to which bodies, &c. could easily be appended: I have also several brass masks, some as large as a man's face, that may answer, and, peradventure, may have answered on similar occasions.

"Jejery temple is very rich: it is said to expend half a lak^h (50,000) rupees, about 6000l. yearly. It is well endowed for Kandeh Rao; and horses and elephants are kept for him: he and his females are bathed in Ganges water, and rode water, perfumed with attar, and decorated with gems. The revenues, like those of most other temples, are derived from houses and lands given by pious people, and from presents and offerings constantly made by all descriptions of votaries and visitors, according to their means, or to their faith, hope, or charity. At the annual jatra, or fair, which commences on the last day of the dark half of the lunar month Chaitra (in January) a lak^h (10,000) or more perfums visit Jejery. It is customary to sacrifice a sheep; and the Brahmins assisted me, that twenty, or, in particular years, thirty thousand are slain on this occasion, and to the honour and glory of Kandeh Rao.

"In another work the same author more particularly describes Jejery as a pretty large town, but, with the exception of a few clockkeepers and retailers of fruit, vegetables, and such small wares, apparently wholly inhabited by Brahmins and beggars, the latter of whom were exceedingly importunate and troublesome. Were it not for its temple, the town is not deserving particular notice. The ascent to the temple is on the north-eastern side, by a handsomely flight of broad stone steps, and being of considerable height, and rather steep, the walk up is somewhat fatiguing; arches are in many places thrown across over the aires, which have, on each side, frequent buildings of stone of a pyramidal form for lights; others have the appearance of recesses. The inner temple, where the deity is placed, is ancient and not very handsome; but the enclosure is elegant and extensive, beautifully finished with fine stone, and the pavement is also large flags. The enclosure is open, and commands a fine view of the surrounding country. There is a very large bank, elegantly built with fine stone, a little to the southward of the hill on which the temple stands, which is about two miles from a range of hills that runs in a south-easterly direction.

"In this temple are kept many beautiful young women, as fingers and dancers: from the account received by Major Moor on the spot, there were more than two hundred at the time of his visit (1792); such as he saw were very handsome. They are here called Attars; which see.

JEKIMABAD, a town of Persia, in the province of Segzan; 60 miles N.E. of Boil.

JEKISINOKORI, a town of Japan, in the island of Nippon; 15 miles N.N.E. of Nagan.

JEKKI, Sir Josiah, in Biography, an English lawyer, was born in Northamptonshire in 1654. Little is known of him in early life, but he distinguished himself in the reign of William III. by a steady attachment to the Whigs. He was appointed one of the managers on the trial of Dr. Sacheverel, and on the accession of George I. he was knighted, made master of the Rolls, and a privy counsellor. He successfully maintained the independence of his office against the
the lord chancellor King, in a pamphlet, entitled "The Judicial Authority of the Mayor of the Rolls: stat'ed and vindicated." Sir Joseph was an excellent patriot, a kind and benevolent man; when it was proposed to subsidize foreign mercenaries, he contended that the practice was repugnant to the maxims by which England, in former times, had flourished and squared her conduct with relation to her interest abroad; that the navy was the natural strength of Great Britain; its bellic defence and security: but if, in order to avoid a war, they should be so free-hearted as to buy and maintain the forces of foreign princes, they were never like to see an end to such extravagant expenses. On another occasion, when it was proposed by his own friends to profeute the duke of Ormond for high treason, sir Joseph said, if there were room for mercy he hoped it would be shewn to that noble, generous, and courageous peer, who had in the course of so many years exerted his talents for the good and honour of his country. He died in the year 1738. His brother, doctor Thomas Jekyl, was educated at Trinity college, Cambrige; became vicar of Rowland in Wiltshire, lecturer at Newland in Gloucestershire, and minister of St. Margaret's-chapel, Westminster. He was author of several sermons and tracts; and of an "Exposition of the Church Catechism." Smollett's Continuation.

JEKYL Island, in Geography, a small island in the Atlantic, near the coast of Georgia, at the mouth of the Alatamaha. N. lat. 31° 7'. W. long. 81° 45'. It is said, that Jekyl has been a few miles in the month of this river will afford safe riding for a dozen ships of 40 guns.

JELALABAD, a town of Hindooftan, in Oude; 18 miles S.E. of Azimgar. - Aflo, a town in Oude; eight miles S. of Lucknow. - Aflo, a town in Rohilkund; 42 miles S. of Bereilly.

JELALPOUR, a town of Hindooftan, in Oude; 17 miles N.N.E. of Raaat.

JELATGUR, a town of Bengal; eight miles N. of Purneek.

JELAUL, a town of Hindooftan, in Lahore; 13 miles N.W. of Rotas.

JELENGHIAN, a town of Curdiftan; 69 miles S.E. of Van.

JELONY, a town of Bohemia; 14 miles S.E. of Konigingratz.

JELGOVAN, a town of Hindooftan, in Bahar; 17 miles N.N.E. of Bahar.

JELINA, a town of Lithuania; 15 miles S.E. of Lida.

JELIOTTE, in Biography, a French vocal performer of great talents and public favour at Paris, which continued undiminished to the end of his life.

He was a native of Bern, of a very good family of that province, and not intended for the profession which he embraced, and which, luckily for the public, his early youth made him prefer to that which would have been more agreeable to his parents, and more beneficial to his rank in life.

No finger was ever gifted with a finer voice, nor knew better how to use it, nor was a better musician than Jeliotte. Though he had been dead 25 years when this article was written, (1783,) the charms of his voice, his taste, and his action were not forgotten, nor the transports by which the public expressed their gratitude, whenever he appeared on the stage.

No one was ever so happy in a great number of friends, or ever better deserved them than Jeliotte. His natural wit, ornamented and polished by his knowledge of the world, and his agreeable personal qualities, made him always fought, for his own sake, as much as for the diversity and charms of his talents. Labords.

JELLA, in Geography, a town of Birmah, on the Ava; 10 miles S. of Lundey.

JELLABA, or Gelab'an calendar, epocha, and year. See Calendar, Epochs, and Year.

JELLANTRA, in Geography, a town of Hindooftan, in the circuit of Cicaco; 36 miles S.W. of Ganjam.

JELLASORE, a town of Bengal; 80 miles S.S.W. of Calcutta. N. lat. 21° 50'. E. long. 87° 16'.

JELLASSAR, a town of the province of Agra, on the borders of Doob; 99 miles S.E. of Delhi. N. lat. 27° 25'. E. long. 78° 44'.

JELLING, a town of Denmark, in North Jutland, formerly a city and the residence of kings; 14 miles N. of Colding.

JELLINGHY, a town of Hindooftan, in Bengal, on the right side of the Ganges; 90 miles N. of Calcutta. N. lat. 24° 6'. E. long. 88° 48'. - Aflo, a river which is a branch of the Ganges, that separates from the main stream near Jellinghy, and after being joined by another branch about 50 miles N. of Calcutta, forms the Hoogly.

JELLOU, a town of Hindooftan, in Oude; 10 miles S.S.E. of Yazabad.

JELLOULAH, a town of Africa, in Tunis; 10 miles N.W. of Cairoan.

JELLY, a form of food, or medicine, prepared from the juices of ripe fruits, boiled to a proper consistence with sugar, or of the strong decoctions of the horns, bones, or extremities of animals, boiled to such a height as to be stiff and firm when cold, without the addition of any sugar. See Har's HORN.

The jellys of fruits are cooling, sapoteuous, and acidulent, and therefore are good as medicines in all disorders of the prime vise, arising from alcalefcent juices, especially when not given alone, but diluted with water. On the contrary, the jellys made from animal substances are all alcalefcent, and are therefore good in all cafes in which an acidity of the humours prevails: the alcalefcent quality of these is however in a great measure taken off, by the adding lemon juice and sugar to them. There were formerly a fort of jellys much in use, called compound jellys; these had the restorative medicinal drugs added to them, but they are now scarcely ever heard of.

The jelly obtained from the various parts of animals contains a mucous substance, very soluble in water, but not in alcohol; and it may be easily obtained by boiling these animal substances in water, and concentrating the decoction, until, by mere cooling, it assumes the form of a solid turbid mass. The jelly of harts-horn is extracted by a similar operation, and afterwards rendered white with the milk of almonds. This kind of food, duly scented, is served up at our tables by the name of "blanc-mange." Jellies are in general restorative and nourishing; that of harts-horn is altrigent and emollient. Jellies in general have, in their natural state, no smell, and their taste is insipid. By distillation they afford an infusion and inodorous phlegm, which easily putrefies. A stronger heat causes them to swell up, become black, and emit a putrid odour, accompanied with white acid fumes. An alkaline phlegm then passes over, succeeded by an empyreumatic oil, and a little carbonate of ammonia. A spongy coal remains, which is with difficulty reduced to ashes, and affords by analysis, murate of soda and phosphat of lime. Water dissolves jellys perfectly; but water dissolves a large quantity, as they become constant only by cooling. Acids and alkalies also dissolve them. The nitric acid diffuses, as M. Berthollet has 4N
flown, nitrogen gas. For other properties, see *Gelatin*.

If jelly be concentrated to such a degree as to give it the form of a cake, it is deprived of the property of putrefying; and thus the dry or portable jellies are formed, which may be of the greatest advantage in long voyages. The following is a receipt given by M. Chapital for preparing these cakes: calves feet, 4; leg of beef, 12 lbs.; knuckle of veal, 3 lbs.; leg of mutton, 10 lbs. Let these be boiled in a sufficient quantity of water, and the fluid taken off as usual; after which the soup is to be separated from the meat by straining and preflure. The meat is then to be boiled a second time in other water; and the two decoctions, being added together, must be kept to boil, in order that the fat may be exactly separated. The soup must then be clarified with five or six whites of eggs, and a sufficient quantity of common salt be added. The liquor is then strained through flannel, and evaporated in the water, both to the convenience of a very thick paste; after which it is spread rather thin upon a smooth stone, then cut into cakes, and lastly, dried in a oven until it becomes brittle; these cakes are kept in well-closed bottles. The same process may be used to make a portable soup of the flesh of poultry; and aromatic herbs may be used as a flavoring, if thought proper. These tablets or cakes may be kept four or five years. When intended to be used, the quantity of half an ounce is put into a large glass of boiling water, which is to be covered, and set upon hot ashes for a quarter of an hour, or until the whole is entirely dissolved. It forms an excellent soup, and requires no addition but a small quantity of salt. The cakes of "bœufcal," which are prepared in China, and are known in France by the name of "colle de peau d'âne," are made with animal fables; they are used in disorders of the lungs, in the dose of from half a dram to two drams.

M. Prout, professor of chemistry at Madrid, has published directions for preparing jelly from bones in a work, entitled "An Inquiry into the Means of Improving the Subsistence of the Soldier." In order to obtain this jelly in an expeditious and cheap manner, he directs that the bones should be reduced into powder which may be very readily done between a pair of toothed iron cylinders, as in the ammoniac works. The bones thus comminuted, are to be boiled in eight or ten times their weight of water for the space of four hours, or till about half the water be wasted, when the liquor will be found on cooling of a due gelatious consistence. A vessel with a tight cover should be used, that the water may acquire as much heat as possible; but it should not be of copper, as this metal is easily dissolved by animal mucilage. According to the experiments of M. Prota, 4 lbs. of the middle part of the bone of a leg of beef, will afford nine pints of jelly; the same quantity of the bone of the joint, 15 pints; of the ribs and spine, 11 quarts; of the rump and edge bone, 13 quarts. Five pounds of mutton bone of every fort together, give 19 pints of jelly. Pig's bones yield a little more, the flavour of which is the most agreeable. In warm weather the liquor must be boiled down somewhat more, if it be intended to assume the family gelatious consistence when cold; as the same quantity of bone that would afford a quart of jelly in winter, will not yield above a pint and a half, or a pint and a quarter in summer, but then it contains proportionally more nourishment. If this jelly be boiled till it acquires a consistence rather thicker than a syrup, then poured out into plates, and when cold cut into pieces, and dried in a net, it will keep a long time, and be particularly useful at sea. One ounce of this dry portable jelly being soaked in water for a quarter of an hour to soften it, and then boiled, will make from a pint and a quarter to a quart of jelly, according to the season, and equally as good as that which is fresh extracted. Mr. P. prepares, as he informs us, a very pleasant retortative for the sick, by 14 ounces of sugar, and a little salt, to 14 or 15 ounces of the jelly, and then making it into an emulsion with 12 sweet and four bitter almonds, and a little orange peel. We shall here add, that Mr. P. chops the refuse bones, before they are ground for extracting the jelly, into pieces about an inch long with a cleaver, then throws them into a kettle of water, and lets them boil for a quarter of an hour. The fat obtained in this manner from 16 lbs. of rump and edge-bones weighed, when cold, two pounds; and from the same quantity of the bones of the joints he obtained four pounds of solid fat. This he oberves, when fresh, may be used for various ordinary purposes; when it has been kept for some time exposed to the air, it becomes very good tallow for making candles.

**JELLY, Flax-seed.** See *Flax-seed Jelly*.

**JELLY, oat.** A preparation of common oats, recommended by many of the German physicians in all hectic disorders, to be taken with broth of linseed or cray-fish. It is made by boiling a large quantity of oats, with the hull taken off, with some hardtack shavings and currants together, with a leg of veal cut to pieces, and with the bones all broken; these are to be set over the fire with a large quantity of water, till the whole is reduced to a foot of jelly, which when strained and cold will be very firm and hard. A few spoonfuls of this are to be taken every morning, diluted with a bason of either of the above-mentioned broths, or any other warm liquor. See *Gelatin*.

**JELLY, Star-wort.** See *Star-wort Jelly*.

**JELMO,** in *Geography*, a small island in the North sea, near the coast of Lapland. N. lat. 74° 8'.

**JELMORE,** a town of Hindooostan, in the cirec of Ciaccole; 15 miles N. of Cicacole.

**JELNA,** a town of Lithuania, in the palatinate of Wilna; 10 miles S.E. of Lida.

**JELLOPOUR,** a town of Hindooostan; 22 miles N.N.W. of Benares.

**JELONGA,** a town of Bengal; 13 miles E. of Deoja.

**JELPESH,** a town of Bengal; 30 miles W.N.W. of Beyhar.

**JELPIGORY,** a town of Bengal; 40 miles W. of Beyhar.

**JELSO,** a town of Norway, in the diocese of Bergen; 22 miles N.N.E. of Stavanger.

**JELVADI,** a town of Asiatic Turkey, in Natalia; 72 miles E. of Iharitch.

**JEMAMA.** See *Imâm*.

**JEMAPETTA,** a town of Hindooostan, in Barmaulal; 12 miles S.E. of Namacul.

**JEMARROW,** a kingdom of Africa, on the S. side of the river Gambia; 120 miles from the sea; inhabited by Mahometans.

**JEMBA,** a river of Russia. Which rises in the province of Upha, and runs into the Caspian sea. N. lat. 46° 57'. E. long. 54° 59'.

**JEMBUT,** in the *Materia Medica*, a name used by Avicenna and others, to express the seed in pods of the carob-tree, or siliqua dulcis; which they call charob or charur, and the Greeks ceratium.

**JEMME,** Et. in *Geography*, a town of Africa, in the kingdom of Tunisia, called also Tidra or Tifroun. This town abounds with antiquities, such as altars, statues, and a spacious
a spacious amphitheatre, in a decayed and mutilated state; 40 miles S.S.E. of Cairoon.

JEMDAAR, a town of Hindooftan, in Bahar: 17 miles E. of Haipour.

JELMAH, a town of Tiheet, which gives name to a district; 230 miles N. of Fyzabad. N. lat. 30° 35'. E. long. 71° 33'.

JEMMAPE, or GERMMAPE, a department of France, being one of the 13 belonging to the region, called the re-united country; formed of portions of Aulbain Hainaut, of Brabant, of Liege, and of Namur; W. of the Sombre and Meuse; in N. lat. 50° 30'. The capital is Mons. It contains, in extent of territory, 3865 kilometres, and in population 412,129 persons. It is divided into three districts, viz. Tournoy, Mons, and Charleroy; 32 cantons, and 423 communes. Tournay has 165,088 inhabitants, Mons 238,533, and Charleroy 107,608. The total of contributions is 3,158,938 francs, and for expenses, administration, judiciary, and for public instruction, 267,267 fr. 76 cents. This department comprehends a great variety of soil and productions, with mines of iron, coal, quarries of marble, &c.

JEMMINGHEN, or JEMEG, a town of East Friel-

land; 8 miles S.E. of Emden.

JEMOO, a river on the N. side of the island of Java, which runs into the sea. S. lat. 6° 37'. E. long. 111° 8'.

JEMRIGAUCHY, a town of Bootan; 13 miles N.E. of Thibet. N. lat. 28°. E. long. 89° 45'.

JEMROUD, a town of the kingdom of Candahar; 30 miles W. of Ghizni.

JEMSEG, a town of New Brunswick; 25 miles E.S.E. of Frederick Town. N. lat. 45° 55'. W. long. 66° 13'.

JEMSERUM, a town of Sweden, in the province of Smaland; 45 miles N. of Calmar.

JENA, a town of Germany, in the principality of Eifel-

nach, near the Saale, situated in a pleasant valley among rising hills, which produce great quantities of wine. It is surrounded with walls, ditches, and towers, and it has an university founded in 1548. The town has four faubsbourgs; 10 miles E. of Weimar. N. lat. 50° 54'. E. long. 11° 30'.—Alto, a town of South America, in the province of Quito; 12 miles S. of Archidona.

JEN, a town of Africa, in Sahara; 200 miles S.E. of Gadames. N. lat. 27° 50'. E. long. 11° 10'.

JENHJIE, a town of the Arabian Trak, on the Tigris; 12 miles N.W. of Bagdad.

JENHJKAND, a town of Turkeftan, on the Sirr; 27 miles W.S.W. of Tonkat.

JENGI, a town of Hindooftan, in the country of Cutch, near the coast; 21 miles S. of Tahej.

JENGOKO, a town of Japan, in the island of Niphon; 50 miles E. of Jedo.

JENHAT, a circc of Hindooftan, in the fubah of Lahore, situated between the rivers Behat and Chumna, about 120 miles long from N. to S. and from 10 to 50 broad; the chief town is Gujjarat.

JENTIPUR, a town of Hindooftan, in Bahar; 20 miles N.E. of Durbungah. N. lat. 26° 14'. E. long. 86° 28'.

JENI-B SOR, or NOVINBASSAR, a town of European Turkey, in Bulgaria, on a branch of the river Ibar, containing about 300 houses, occupied by Christian and Turks; anciently the capital of the Irianis; 83 miles N.E. of Ragufa. N. lat. 43° 40'. E. long. 19° 59'.

JENJEREE, a town of Hindooftan, in Bahar; 30 miles N.E. of Monghier.

JENJIAM, a town of Hindooftan, in Moultan; 45 miles W. of Adjedin.

JENIKALE, a town of Russia, in the government of Taurida, in the narrow channel, called the lroat of Taman, between the Black Sea and the Sea of Azof; 15 miles N.E. of Kerch. N. lat. 45° 10'. E. long. 36° 10'.

JENIKOW, a town of Bohemia, in the circle of Czafaln; 24 miles S.W. of Czafaln.

JENISHEHR, a town of Persia, in the province of Jorjien; 15 miles S.E. of Jorjan.

JENITZA, a town of European Turkey, in Macedonia, seated on a lake that communicates with the gulf of Saloni by means of a canal about twelve miles long, and the capital of Macedonia, but now a heap of ruins; 23 miles W.N.W. of Salonic. N. lat. 42° 48'. E. long. 22° 50'.

JENKIN, Robert, in Biography, was born at Minster, in the diocese of Thanet, in Kent, in the year 1656. He received his classical education in King's school at Canterbury, whence he went to the university of Cambridge when he was about eighteen years of age. In 1685 he was elected fellow of St. John's college, and five years afterwards appointed chaplain to Dr. Lake, upon the translation of that learned prelate from Britton to the see of Chichester. In 1688 his patron gave him the precentorship of his cathedral church, but upon his refusing to take the oaths at the revolution he was obliged to resign that preferment, and to retire also from his fellowship. Little is known of Mr. Jenkins during the next twenty years, but we find him doctor of divinity and master of his college in the year 1711, and at the same time he was appointed lady Margaret's professor of divinity. On the accession of George I., an act was passed obliging all those who held any office, of 51. per annum, to take the abjuration oath. Dr. Jenkins had, at this period, no hesitation in conforming, but he was so much affected at being obliged to eject many worthy and conscientious men who could not submit to be cast into a state of childlessness. He died in the year 1727. As an author he is known by "An historical Examination of the Authority of General Councils, shewing the fallacy of Dealing which hath been used in publishing them," "The Reformation and Certainty of the Christian Religion," and many controversial pieces, particularly "Remarks on some Books lately published," viz. M. Balfour's History of the Jews; Mr. Whilton's eight Sermons; Mr. Locke's Paraphrase, &c." In another work he accuses M. Le Clerc of treating the fathers, especially St. Augustine, with unjust severity.

JENKIN'S Town, in Geography, a settlement on the coast of Africa, in the country of Scherbro. N. lat. 7°. W. long. 11° 50'.

JENKINS, Sir LEOLING, in Biography, a pateaman, was born at Llantrisaint, in Glamorganshire, in the year 1632. Having laid a good foundation in grammar-learning at Cowbridge, he went to Oxford, where he remained till after the death of the king in 1648. Upon that event he retired into his native country, and was employed in the tuition of the eldest son of Sir John Aubrey, and other young persons of family attached to the episcopal church. At length, falling under some suspicion, he thought it advisable to go abroad. During three years he led his pupils through a course of study and travel upon the continent; when he returned and lived in retirement till the restoration. In 1661 he was chosen principal of Jesus college, a poit which he held till 1672. In the mean time he applied himself diligently to the civil law, was admitted an advocate of the court of arches, and rode successfully to the office of judge of the admirality.
and judge of the prerogative court: he was likewise appointed one of the commissioners for recovering the effects of the queen-mother of France, lately dead. For his services on this occasion he had the honour of knighthood conferred upon him. In 1673 he was appointed one of the ambassadors plenipotentiary for concluding the peace of Nimeguen, and on his return to England he was elected representative in parliament for the university of Oxford, where he opposed the bill for the exclusion of the duke of York, soon after he was made secretary of state and a privy councilor. He died in 1685, and was buried in the chapel of Jesus college, to which he was a great benefactor. His letters and papers were printed in two volumes folio. "He was," according to bishop Burnet, "a man of exemplary life, and considerably learned; but he was dull and slow: he was a great afflior of the divine right of monarchy, and was for carrying the prerogative very high. He neither spoke nor wrote well." He bequeathed the greater part of his property to charitable uses. *Biog. Brit.*

**Jenkins, John**, an English musician of great eminence in the 17th century, was born at Maidstone, in Kent, 1592. He was a voluminous composer of fanes for viols during the reign of Charles I. and the interregnum, which were in great favour throughout the kingdom. Instrumental music was in a very rude state at this time. His first publication, however, was vocal, being a collection of songs under the title of "Theophilia, or Love's Sacrifice," folio, 1651. None of the infinite number of pieces that he composed for viols, which occur in all the manuscript collections of the times, were printed; yet in 1660, he published twelve fantasias for two violins and a base, with a thorough-bafe for the organ or theorbo, which were re-printed in Holland, 1664. These were professedly in imitation of the Italian style, and the firl of the kind which had ever been produced by an Englishman. It was at this time an infallite of great condescension for a musician of character to write expressly for fiddle and vultur an instrument, as the violin was accounted by the lovers of lutes, guitars, and all the fretful tribe.

In manuscript memoirs of music, written by the honourable Roger North, of Rongham, in Norfolk, brother of the lord keeper North, to which we were allowed access by his descendant, the late Rev. Dr. Montague North, canon of Windor, there is a very diffusive account of Jenkins, the circumstances of whose life have suggested to the author many moral reflections on the infallibility of musical renown. "It is of small importance," says he, "to the state of the world, or condition of human life, to know the names and styles of those composers of our own country who have excelled the Italians themselves in every species of music, but that for the voice; therefore the oblivion of all such things is no great loss. But for curiosity sake, as other no les idle antiquities are courted, it would double his afford satisfaction to professors and lovers of the art, if they could acquire true information concerning their names, characters, and works: of the latter, much knowledge might be obtained, if the old collections, not yet rotten, of many patron's music were accessible. In these we might find the productions of Alphonso, Ferabosco, Coperario, Lupo, Mico, Effe, and divers others, especially of John Jenkins, whose musical works are more voluminous and, in their time, were more esteemed than all the rest, though they now (1728) lie in the utmost contempt.

"I shall endeavour to give a short account of this matter, with whom it was my good chance to have had an intimate acquaintance and friendship. He lived in king James's time, and flourished in that of king Charles I. His talents lay chiefly in the use of the lute and base, or rather lyra-viol. He was one of the court musicians, and was once brought to play upon the lyra-viol before king Charles I. as an extraordinary performer. And when he had done, the king said he did wonders upon an inconsiderable instrument. The lyra-viol was a viol da gamba, with more strings, but differently tuned from the common six-string base. Its notation, like that of the lute, was written in tablature. He left London during the rebellion, and passed his time as a musical gentleman's house in the country, where he was always courted, and at home, wherever he went; and in most of his friends house there was a chamber called by his name. For, besides his musical excellencies, he was an accomplished and ingenious person, and of such inoffensive and amiable manners, that he was esteemed and respected for his virtues and disposition, long after age had deprived him of his musical powers.

"It is not possible to give an account of his compositions, they were so numerous, that he himself outlived the knowledge of them. A Spanish nobleman sent some papers to sir Peter Lely, containing fragments of a concerto (concerto), in four parts, of a strangely kind, such as were then called fanes, defining that he would procure for him the refl, *cold fugit rubies.* Lely gave me these papers, as the likeliest person to get them perfected. I flew them to Jenkins, who said he knew the concerto to be his own; but when or where composed he knew not, and was unable to recollect any more about it.

"His fantasies were full of airy points, grave and triple movements, and other variety. And all that he produced till his declining age, was lively, active, decided, and fanciful. And of this kind he composed so much, that the private (or chamber) music, in England, was in a great measure supplied by him; and they were more coveted, because his style was new, and, for the time, difficult: for he could hardly forbear divisions, and some of his conrorts were too full of them. But it must be owned, that being an accomplished master on the viol, all his movements laid fair for the hand, and were not so hard as they seemed.

"His veins was leys happy in vocal music, though he was fond of setting words, and occasionally of teaching to sing; but he had neither voice nor manner fit for it. In his frightful moments he made matches, [nothing of this kind now remains of Jenkins, but his little round: "A boat, a boat, haste to the ferry," which is a happy fellection and combination of pleasing sounds,] and strains that we called rants, with a piece called "The Cries of Newgate," which was all humour and very whimsical. But of all his concerts, none flew about with his name so universally as the small piece called his "Bells," or "The Five Bell Conforte." In those days the country fiddlers were not so well supplied with light music from London, as since; and a matter that furnished them with new tunes, that they were able to play, was a benefactor."

Jenkins lived to the great age of eighty-six, eighteen years after the reflation. And Mr. North, the author of these memoirs, who was born in 1650, lived till 1733.

**Jenkins's Bay**, in *Geography*, a bay on the back part of the island of St. Eustatius.

**Jenkins's Island**, a small island near the coast of South Carolina. N. lat. 32° 20'. W. long. 80° 40'.

**JENKING**, in *Mining*, is applied, in some districts, to the last operations in a coal-pit, or some part of the same, which is about to be abandoned: that of perforating, or robbing
robbing of the pillars' or ribs of coal which have been left to support the roof.

JENKINS, DAVID, in *Biography*, an intrepid judge, was born at Pendoylen, in Glamorganshire, and admitted a commoner of Edmond-hall, Oxford, in 1597. From thence he removed to Gray's-inn, and became an eminent counsellor. By king Charles I. he was appointed a Welch judge, and in 1644 he was taken prisoner at Hereford for his activity in the royal cause, and sent to the Tower. Being brought to the bar of the house of commons he denied the authority of the house, and refused to kneel, for which he was fined 1000 l. and remanded to prison. In 1650 an act was passed for his trial, but it never took place. He expected to be hanged, and declared that he would die with the bible under one arm, and magna charta under the other. In 1656 he obtained his liberty, and died in 1663. His tracts on legal and political subjects were printed in 1681, in one vol. 12mo.

JENN, in *Geography*, a town of Africa, in Bambarra, situated on an island in the river Niger or Joliba, at the distance of two days' journey from the lake Dibbie in the same river; about 150 miles N. of Sego, and about 165 miles S. W. from Tombuctoo. N. lat. 15° 17', W. long. 0° 40'. Although the town of Jenn is nominally a part of the king of Bambarra's dominions, it is in fact a city of the Moors; the chief part of the inhabitants consisting of Bushreens, or Mahometans, and even the governor himself being of the same stock.

JENNE', a town of Japan, on the N. coast of Niphon; 8 miles N. W. of Kanazava.

JENNET, in Horsemanship. See Horse.

JENNIDAII, in *Geography*, a town of Bengal; 14 miles N. W. of Mahmudpour.

JENNINGS, DAVID, in *Biography*, son of an ejected minister, was born at Kibworth, in Leicetershire, in the year 1661. He obtained a good flock of grammar learning at the free-school of his native place, and about the year 1700 he was sent to pursue a course of academical studies in London, under the care of Dr. Channey. Having finished his studies he was appointed one of the preachers at an evening lecture at Rotherhithe, and in 1716 chose ailiant preacher at the meeting near Haberdashers-hall. Two years afterwards he was elected pastor to the congregational church in Old Gravel-Lane, Wapping, with which he maintained that relation during forty-four years. Within a year after he entered this charge, he shewed his respect and attachment to the rights of confciencen, by refusing to comply with the requisition brought forwards by many of the brethren at Salters-hall, to sign certain articles relating to the Trinity. Mr. Jennings, about the year 1730, published a small volume of sermons adderssed to the young, entitled "The Beauty and Benefit of Early Piety," which was followed by other publications of a practical nature. In the year 1746 he entered the bills against Dr. John Taylor, concerning Original Sin. He justified the doctrine, and did not act as the fair and liberal antagonist; but notwithstanding their difference in doctrinal points, they were in habits of intimacy and friendship with each other as gentlemen. In the year 1743 Mr. Jennings was elected trustee of Mr. Coward's charities, and one of the lecturers at St. Helen's; and in the following year he became divinity tutor, in the room of Mr. Eames, at the academy, at that time chiefly supported by Mr. Coward's funds. In this work he was earnestly intent: nothing ever diverted him from a daily attendance in the lecture room; and he was indefatigable in the discharge of the duties belonging to his office. The habits of early rising, of order in the arrangement of business, and of punctuality in his engagements, enabled him to perform more than most men would have been able to get through. As a relief to the studies of the mind he employed himself in the common mechanical arts of life. His method of communicating instruction was easy and familiar, and his general deportment towards his pupils affable and friendly. In some instances he was betrayed into acts of illiberality, which ill accorded with that spirit which his life led him to maintain. To fulfill the imposition of a formal livery of faith, devoted by the violators at Salters-hall. He was determined to maintain, in his academy, the reputation for orthodoxy which it had acquired, and would not suffer young men to deviate from his standard of faith. In some cases he had recourse to expulsion, although the characters of the pupils thus treated were most blameless and exemplary. In the year 1747 Mr. Jennings published an "Introduction to the Use of the Globes," &c. which maintained a considerable degree of popularity for more than half a century. In 1749 the university of St. Andrew's in Scotland conferred on the author the degree of doctor of divinity. After this, he published "An Appeal to Reafon and Common Sense for the Truth of the Holy Scriptures." He died on September 17th, when he had not yet come to the years of age. He was highly valued by his acquaintance, and he had the honour to educate many pupils who proved ornaments to the dissenting interest, and have rendered eminent service to science and the world, some of whom still sustain, by a diligent application of great talents, a respectable and commanding rank in life. After his death, was printed, from a MS. copy, "An Introduction to the Knowledge of Medals," consisting of a course of lectures on the history, the nature, size and shape; the orders into which they are to be distinguished;—the impression and form, and value and use of medals. In 1766 a more elaborate work was published by Dr. Furneaux from the MSS. of Dr. Jennings, entitled "Jewish Antiquities: or a Course of Lectures on the Three First Books of Godwin's Mofes and Aaron: to which is annexed a Dissertation on the Hebrew Language"; in two vols. 8vo. This is a work of great merit, and deserves the perusal of all who would obtain an intimate acquaintance with the scriptures, particularly of the Old Testament. A new edition of the "Jewish Antiquities" was published about three years since, it having been long out of print, and very much called for.

JENNINGS'S ISLAND, in Geography, a small island in the gulf of Florida, near the coast of East Florida. N lat. 25° 28'. W. long. 86° 58'.

JENNY WREN. See WREN.

JENNOYPOUR, in Geography, a town of Hindoostan, in Allahabad; 24 miles N. of Gazypore.

JENSON, or JANS, NICHOLAS, in Geography, an eminent printer of the 15th century, was brought up to the art of engraving. He was taken away from his employment by Lewis XL., and sent to Mentz to endeavour to bring away the secret of the new discovery of typography. By another account it should seem that he was sent on this mission by Charles VII. in 1458, and it says, that Jenon, on his return, finding that the king was dead, went and settled elsewhere. He exercised his profession at Venice, in which he acquired a high degree of reputation in the the three branches of cutting punchers, founding types, and printing. He formed the present Roman character, the neatness of his type command admiration even in the modern improved state of the art, and his editions are in great request with the connoisseurs. The first work which issued from Jenon's press is one entitled "Decor Puelrarum," in 1471. Several editions of Latin books followed, of
of which the one of the latest date is 1481, thought to be the last year of his life.

JENTLING, in Ichthyology, the name of a river fish caught in the Danube, and most of the great rivers in Germany, and called by the German felt, floten for, and koper; and by Gellner capito carabous, the blue chub. See CYPRINUS JETI.

JENUCHSHADEGA, in Geography, an Indian village in Pennsylvania, on the W. bank of Alleghany river; 14 miles S. E. from the outlet of Chataugua lake.

JENYNS, SOANE, in Biography, the only son of Sir Roger Jenyns, of Bottisham Lint, Cambridgeshire, was born in London in 1704. He was educated under his father's roof till he was seventeen years of age, when he was entered a fellow-commoner of St. John's college, Cambridge. He was diligent in his studies, and spent three years at the university, after which he entered upon a course of life well adapted to a man of independent fortune. In his first marriage he was not fortunate, a separation took place, which the lady did not long survive; but his second wife outlived him. In younger life he fulfilled the character of a beau, and his polite attention to the ladies was displayed in his first performance, as an author, which was a poem on "The Art of Dancing," published in 1728, and dedicated to lady Fanny Fielding. From this period he continued to make himself known occasionally by pieces in verse, which were sufficiently numerous to be collected into a volume in 1752. At the death of his father his fortune enabled him to become a representative in parliament for the county of Cambridge. He began his senatorial career by supporting Sir Robert Walpole, probably on account of his attachment to the Whig interest, and he continued ever afterwards the habitual adherent to the minister for the time being. This plant conduct was rewarded by the place of one of the lords of the Board of Trade, which he held from 1755, through every change, till the Board itself was abolished, as an idle appendage to government, in the year 1780. He was ever inclined to moderate measures, and was in his own mind against the coercion made use of with regard to the Americans; he wrote in defence of dean Tucker's scheme of leaving the colonists to themselves, with the expectation, that when tired of freedom, they would gladly refuse their dependence on the mother country. As an author, Mr. Jenyns attained a considerable share of celebrity. His poems consist of a variety of miscellaneous pieces; but his prose works are, in point of style, of a superior degree of excellence: his language is pure and picturesque, and at the same time animated with wit and embellished with eloquence. He was a contributor to the periodical publication entitled "The World," and his papers, five in number, are distinguished by humour and vivacity. In 1757 he published a "Free Enquiry into the Origin of Evil, in six Letters." To account for the existence of evil under the government of an infinitely wise and good Being, he thought that to produce good exclusive of evil is one of those impossibilities which even divine power cannot accomplish. This related to natural or physical evil; with respect to moral evil, his theory was, that it is permitted in order to provide objects for the just infliction of those natural evils which were unavoidable. His work produced many able replies, besides a very severe and masterly critique from the pen of Dr. Johnson, which appeared in the Literary Magazine, and which Jenyns never forgot nor forgave. In 1756 he published a pamphlet in favour of a "National Lottery," and in 1757 another, entitled "Thoughts on the Causes and Consequences of the High Price of Provisions," &c. which proves that he paid much attention to political economy. In 1776 he refuted his theological diffusions by a work which was much read, viz. "A View of the Internal Evidence of the Christian Religion." The foundation of his reasoning in this piece is, that this religion maintains a system of ethics not only superior to, but unlike every thing which had before entered into the mind of man, and therefore that it must have had a divine origin. He contends that it not only carries moral purity to a degree beyond what was ever inculcated by any sect of philosophers, but that it wholly omits or disparges many virtues on which they lay a great stress; as valor, patriotism, and friendship. He contends that it must be of divine origin because no man could have imagined or proposed such a system. This kind of defence of the truth of our holy religion led to the suspicion that he was, under the mask of friendship, undermining its foundation, and he met with some severe strictures from several friends of rational religion, who were unwilling to abandon reason in their regard for Christianity. Upon, however, a fair and candid view of the subject, Mr. Jenyns was probably a very sincere Christian; the whole of his life and conversation bore witness to the sincerity of his views. In 1782 he published "Disquisitions on various Subjects:" in these he argues for the pre-existential state of mankind for the purpose of accounting for the miseries to which they are exposed in this world: and with regard to Christianity he says that its doctrines are so adverse to all the principles of human reason, that, if brought before her tribunal, it must evidently be condemned; but the chief force of his wit and argument is directed against the principles of civil liberty, towards which he feews the most determined hostility. He died at the advanced age of eighty-three, in December 1787. As a country gentleman he maintained a very respectable character: he was upright in his conduct, and exemplary in the performance of religious duties. With the blessings of a man of wit he joined the urbanity of a polite well-bred gentleman, and his socia! intercourse is represented as highly engaging and delightful. His works have been collected in 4 vols. 12mo., to which is prefixed an account of his life.

JEBOFAILE, or JEFOYIE, in Law, a composed of three French words je ay faile, I have failed. It is used in a legal sense, when the parties to any suit have, in pleading, proceeded too far, so that they have joined issue, which shall be tried, or is tried by a jury, and this pleading or issue is badly joined, so that it will be error if they proceed. In this case, one of the parties might, by their counsel, shew it to the court, as well after verdict given, as before the jury was charged, by saying, "This is a false pleading, I have failed." It is used in a legal sense, when the parties to any suit have, in pleading, proceeded too far, so that they have joined issue, which shall be tried, or is tried by a jury, and this pleading or issue is badly joined, so that it will be error if they proceed.

But this occasioning great delays in suits, for the relief thereof several statutes were made; viz. 32 Hen. VII. cap. 30. by which it was enacted, "That if the jury have once passed upon the issue, though afterwards there be found a j efoyle in the pleading, yet shall judgment be given according to the verdict of the jury." Other statutes have also been made relating to the same thing, in the time of queen Elizabeth and king James I. The 18th Eliz. cap. 14. ordains, that after verdict given in any court of record, there shall be no flay of judgment, or reversal, for want of form in a writ, count, &c. or for want of any writ original or judicial; or by reason of insufficient returns of sheriffs, &c. This is not to extend to appeals of felony, indictments, &c. By 21 Jac. I. cap. 13. if a verdict shall be given in any court of record, the judgment shall not be flayed or reversed for variance in form between
JEFP

between the original writ or bill, and the declaration, &c., or for want of averment of the party's being living; or because the 

vouer facias is in part misread; for mimisher of 

jurors; want of return of writs, or because the return 
officer's name is not set to the return, &c. The flat & 17 Car. II. cap. 8. enacts that judgment shall not be stayed 
or revered after verdict in the courts of record at West-

minster, &c. for default in form; or because there are not 

pledges to prosecute upon the return of the original writ, 
or because the name of the sheriff is not returned upon it, for 
default of alleging the bringing into court of any bond, &c. 
or for the omission of "et arma, o contra pacem"; misfaking 

the Christian name or surname of either party, or the him 
of money, day, month, or year, &c. in any declaration or 

pleading, being rightly named in any record, &c. preceding, 

&c. But all such defects as are not against the right of 

the matter of the suit, or whereby the issue or trial are 

altered, shall be amended by the judges, though not in 

uits of appeal, of felony, indictments, informations on penal 

statutes, which are excepted out of the act. The 32 & 23 

Car. II. cap. 4. made this act perpetual. By 4 & 5 Ann. 
cap. 16. all the statutes of jeofails shall extend to judgments, 

entered by confession, nil deict, or non sum informatus, in any 
court of record; and no such judgment shall be revered, 
or any judgment or writ of inquiry of damages thereon 
shall be stayed, for any defect which would have been added by 
these statutes, if a verdict had been given; so as there 

had been an original writ filed, &c. The 2 Geo. I. cap. 13. 
ordsains, that, after verdict given, judgment shall not be 

stayed or revered for defect in form or substance, in any bill 
or writ, or for variance therein, from the declaration, or any 

other proceeding.

JEGERY, in Geography, a town of Africa, in the 

kingdom of Jarga. N. lat. 13° 12' W. long. 14° 57'.

JE OUASET, a town of the Arabian Trak, on the 

Tigris; 110 miles N.W. of Baliah.

JEPHTHAH, in Scripture History, one of the judges 
of Israel, was a son of Gilead by one of his concubines, 

(Judg. xi. 1, 2) who, upon his father's marriage, was expel-

elled by the family from their house; and who, retiring 

into the land of Tob, became captain of a band of rovers. 
The Israelites, who inhabited beyond Jordan, being pressed 

by the Ammonites, applied to Jephthah for assistance, and 

offered to place themselves under his command; accordingly he 

conceded to succour them on condition that at the end of 

the war they would acknowledge him for their prince. A.M. 

2817. B.C. 1187. Jephthah, having been invested with the 

chief command, remonstrated with the king of the Ammon-

ites on the injustice of the war in which he was engaged, and 

obtaining no satisfactory reply, he levied a powerful army, 

and marched against him to battle. But before he engaged, 

he made a vow, that he would sacrifice, or consecrate to him, 

the first living creature that should come out of his house to 

meet him on his return. The contest was soon decided by a 

complete victory; and the conqueror, as he approached 
his house at Mizpeh, perceived his daughter, an only child, 
advancing to congratulate him on his successes, with music and 
dancing, and other tokens of filial affection. Recollecting 
his vow, the interview occasioned the most poignant 

afflictions; but when he communicated it to his daughter, she 

received the intelligence with a firm and submissive mind; and determining 
to acquiesce in the accomplishment of her father's vow, she 

merely requested a delay of two months, that she might 

retire with her companions to lament her infidelity in being 
devoted to a life of celibacy. At the expiration of the stipula-

ted interval, she returned to her father, "who did with her 

to accept of the vow which he had vowed." As to the ob-

ject of this vow, and the manner in which it was fulfilled,

Jewish and Christian writers, both ancient and modern, have 

entertained very different sentiments. It has been a very 
generally received opinion, that Jephthah offered his daughter 
as a burnt sacrifice; and in favour of this notion it has been 

alleged, that it is most agreeable to the natural construc-

tion of the Hebrew text; that there is no rule, or precedent in 

scripture, to justify the practice of devoting persons to per-

petual virginity, and that this would have been as contrary 
to the law of God as if he had sacrificed her; that when 

Jephthah made this vow, he could have expected no person 
to come out of his door to meet him, but a human person; 

that if he had intended no more than the sacrifice of a bullock, 
or a ram, there was no occasion for such a solemn vow, or 

if he had meant a brutal sacrifice, he would have vowed the 

offering of hecatombs rather than of a single animal, on an oc-

casion which he thought of important and interesting; and, 

moreover, that it was a "covenant in Israel, that the daughters 
of Israel went yearly to lament the daughter of Jephthah," 

(Judg. xi. 39, 40.) and this covenant, it is said, seems to have 

been intended for an annual rite in perpetuum, and not that 

they went yearly to talk with her, as long as she lived. 

On the other hand, it has been maintained by writers of great 
celebrity, that Jephthah, a judge of the Hebrew people, 
who were more worshippers of the true God, whose law did 
not admit of human sacrifices, who had often declared his 
abhorrence of such abominations, and who had, on this ac-

count rejected the Canaanites, could not have been guilty 
of this greatest act of heathen superstition; more especially 

as his name is connected with other ancient worthies, who in 

the epistle to the Hebrews (xi. 32.) are enumerated as illust-

rious in the power of faith. Accordingly they have argued that Jephthah devoted his daughter to perpetual 

virginity, for the honour, and in the service, of God. They 

allege, that the desired time, before the vow was accom-

plished, to bewail her virginity, and not the loss of her life. 

(Judg. xi. 37.) The object of the vow was, therefore, per-

petual virginity, and not death; and Jephthah would natu-

rally be troubled, when his daughter met him (v. 35.) be-

cause she was his only child (v. 34.), and the accomplishment 
of his vow, in the milder sense of it, would render his family ex-

tinct in Israel, and he would thus exclude himself from the 

prospect of having the Messiah among his descendants. In fa-

vour of this interpretation it is further supported, that the words חרבנה חזרנה חזרנה (Judg. xi. 40.) 

which we render "to lament the daughter of Jephthah," should 

be rendered "to talk with the daughter of Jephthah," that is, 

to visit and comfort her in her reclusive life; the word חזרנה 

being justly rendered (Judg. v. 11.) to relieve. It is further 

said, that in the words חרבנה חזרנה חזרנה חזרנה that occur in Jephthah's vow (Judg. xi. 31.), the \( \text{vav} \) should be understood not copulatively, but disjunctively; and 

then the meaning would be, "whatever cometh to meet 

me, shall either be the Lord's, or I will offer it up for a burnt 

offering;" that is, in case it should be a creature fit for fa-

cricise. Others have thought it necessary to vindicate Jep-

thah's character from the blemish of murder; they have also 
pioneered, that he is not censured in any part of his history 

for this act; that God would not have given victory and 
succes to Jephthah in his expedition against the Ammon-

ites, upon his obliging himself under a solemn vow to offer a 

human sacrifice; and that he is mentioned, as we have 

already said, in the catalogue of believers in the epistle to 

the Hebrews. Although we can lay no great stress on 

some of the arguments that are alleged in vindication of 

Jephthah's character, and we cannot help considering his 

vow as rash and unguarded; we must incline to the more
favourable opinion. It is not improbable, that Homer
grounded his fable of Agamemnon's sacrificing his daughter
Iphigenia on some tradition of Jephthah's sacrifice; and it
is urged, that the name of Iphigenia seems to be a corruption
of Jephthigenia, the daughter of Jephthah. Ovid, who
has drest up the story in his way, makes Diana put a flag
in her room; and seems, therefore, to have blended the tra-
dition of Abraham's sacrifice with that of Jephthah.

Soon after Jephthah was exalted to that dignity, it was
which the recompence of his valour, the Ephraimites,
envious of that glory in which they had not been allowed to
come to him; but the contest was soon determin'd by their entire defeat. The Gileadites, whom
he had commanded, seiz'd the fords of the river Jordan, and
put to death all those fugitives who endeavoured to escape
into their own country; and in order to disquiet the Ephraim-
ites from other Israelites, who had occasion to cross the
river, he ordered them to pronounce the word "Shibbo-
leth," signifying an ear of corn, which was pronounced
"Sibboleth" by those of that tribe. As many, there-fore,
as were detected by this test were killed without mercy.
The number of the Ephraimites that fell on this occasion amounted to 42,000.
After this event we know nothing
more of Jephthah, excepting that he judged Israel, or the
two tribes; and a half beyond Jordan, five years, and then
died about the year 1182 B.C. Judges, xi. xii. Calmet's Hift. Bible. Capelli Distrib. de voto Jephth. Aput Crì-
ticos Sacros in Jud. xi. Fawkes's note on Heb. xi. 52.

country of Quoja.

JEREDA, a town of Africa, in the kingdom of Fornia.

JEREMIAH, in Scripture History, a canonical book of
the Old Testament. The divine writer was of the race of
the ten priefts: the fon of Hilkiah of Anathoth in the tribe
of Benjamin. He was called when very young to the pro-
phetic office, about the thirtieth of Josiah, or 628 B.C.;
and continued in the discharge of it above forty-one years. Jeremiah's life was often exposed to danger, and he was com-
mitted to prison, on account of his remonstrances against
the kings of Judah, and the predictions, delivered by him,
which announced the calamities that awaited them; parti-
cularly under the reign of Jehoiakim and of Zedekiah.
After the conquest of Jerusalem by Nebuchadnezzar, he
was fet at liberty by order of the king, and it was left to his
option either to accompany Nebuzaradan, the general of
Nebuchadnezzar, to Babylon, or to remain in Judea with
Gedaliah, who was appointed governor of the miserable
remnant of the people that was left in that country. Jer-
emiah preferred the latter alternative, and went to reside
with Gedaliah at Mizpeh. After the affaifination of Ged-
aliah, Jeremiah, accompanied by Baruch, removed to Egypt.
Of the subsequent events of his life, we have no authentic
account. He is said by St. Jeron, &c. to have been itoled
to death by the Jews at Tahpanhes, where he refr'd, for
preaching against their idolatry; but it is most likely that
he died in Egypt, much advanced in years, and broken by
the calamities which happened to himself and his country.
Some rabbis, however, affirm, that he returned to Judea, and
others say that he went to Babylon, and died there.

There were several collections of Jeremiah's prophecies;
one made by God's command in the fourth year of Jehoi-
akin, chap. xxxvi. 2. This contained all the prophecies
he had published to that time, as well as against the other
nations as against the Jews. The former of these in our
present collection are put by themselves at the end of the
book, from chap. xlv. to the end of the last. But in the
present copies of the Septuagint they follow immediately
after the thirteenth verse of the twenty-fifth chapter. An-
other collection of these prophecies, mentioned chap. i. 3,
comprehends all those which Jeremiah had uttered to the
Jews in that time, and were probably collected by Bar-
uch, his amanuensis, and are put together without any re-
gard to the order of time. To this was added another col-
lection of prophecies, published about the time of his going
down into Egypt, contained in chap. xlii. xliii. xlv. at
the end of which Ezra, or some others, after the captivity,
added those prophecies which Jeremiah delivered against
the Gentiles. The fifty-second chapter was probably added
by Ezra, and is chiefly taken out of the latter part of the
second book of Kings, with additions, which Ezra might
fupply out of the public records. The book of Jeremiah
is altogether written in Hebrew, except the eleventh verfe
of the tenth chapter, which is Chaldean.

It has been observed, that there is great confufion in the
arrangement of Jeremiah's prophecies. A late excellent
commentator, Mr. Blaney, has endeavoured, with great
judgment, to reftore their proper order, by a tranfposition
of the chapters, wherever it appeared to be neceffary. The
first twelve chapters feem to contain all the prophecies that
were delivered in the reign of Josiah. Soon after the ac-
ception of Jehoiakim to the throne, upon the deposition
of Jehoahaz, Jeremiah was commifion'd to denounce the divine
judgments againft him and the people, unless they repented
of their wickednefs. He thus provoked their indiguation;
and they accused him as a perfon whose feditious deferved
death. He was acquitted, however, by the nobles, and by
a powerful influence preferred from the king's vengeance.
About four years afterwards he predicted the deftruction of
Jerufalem and of the temple, and the Babylonifh captivity,
which he foretold would laft 70 years. For this prophecy he
was fet to prison, and he narrowly escaped with his life.
His prophecies under this reign are continued from the
13th to the 20th chapter inclusively; to which we must add
the 22d, 23d, 25th, 26th, 27th, 36th and 36th chapters, to-
gether with the 46th, 47th, 49th, and probably the 48th, as far
as the 34th verse of the 49th chapter. Under the reign of
Zedekiah, the laft king of Judah, Jeremiah was frequently
deputed to the exercife of his prophefyc office. His pre-
dictions in this reign were contained in the 21st and 24th
chapters, the 27th to the 34th, and the 37th to the 39th
inclusively, together with the last five verses of the 49th
chapter, and the 50th and 51st chapters concerning the fail
of Babylon. It does not appear at what period of Jer-
emiah's life he delivered the prophecy concerning the future
reftoration of Israel to their own land, and the re-establish-
ment of their civil and religious constitution under the
Meffiah, comprized in the 31st and 31st chapters.

St. Jerome has observed upon this prophet, that his fyle
is more eafy than that of Isaias and Hofea; that he re-
tains fomething of the rudicity of the village where he
was born; but that he is very learned and majestic, and equa...
equal to those two prophets in the fulness of his prophecy.

We shall close this article with an extract from the admirable lectures of bishop Lowth (see lec. xx.) relating to the character of Jeremiah as a writer. "Isiah," he says, "Jeremiah, and Ezekiel, as far as relates to style, may be said to hold the fame rank among the Hebrews, as Homer, Simonides, and Alciphylus, among the Greeks." "Jeremiah, though deficient neither in elegance nor fulness, must give place in both to Isiah. Jeremias feems to object against him a sort of profusion of language, no vestige of which I myself, however, have been able to discover. His sentiments, it is true, are not always the most elevated, nor are his periods always neat and compact; but there are faults common to these writers, whose principal aim is to excite the tender affections, and to call forth the tear of sympathy or sorrow. This observation is very strongly exemplified in the Lamentations (see that article), where these are the prevailing passions; it is however frequently intimated in the prophecies of this author, and most of all in the beginning of the book (ch. ix. xiv. 17, &c. xxv. 14-18) which is chiefly poetical. The middle of it is almost entirely historical. The latter part, again, consisting of the five last chapters, is altogether poetical (ch. xiv.—xxv. 59); it contains several different predictions, which are distinctly marked, and in these the prophet approaches very near the fulness of Isiah. On the whole, however, I can fearlessly pronounce above half the book of Jeremiah to be poetical."

The version of Mr. Blaney, published in 1784, and accompanied with numerous and valuable notes, is deemed to be the best extant; the author having availed himself of the afforded by Dr. Kennicott's collection, and other sources of information, domestic and foreign. Blaney's notes. Lowth's Sacra Poetae Pral. lect. xxi. Dupin's. Lowth's Paraph. Gen. Biog.

JEREMIAH, in Geography, a town of Palestine, anciently called Anathoth, the birth-place of the prophet Jeremiah; 6 miles E. of Jerusalem.

JEREMIE, Cape, a cape on the S. coast of the island of Hispaniola. N. lat. 18° 14'. W. long. 77° 15'.

JEREMIE, a jurisdiction, town, and cape, within the bay of Leogane, on the southern peninsula of the island of St. Domingo. The jurisdiction contains two parishes, and its soil is excellently adapted for the culture of coffee. The town is seated on the W. side of the bay; and point Jeremie lies in N. lat. 18° 42' 30". W. long. from Paris 76° 32'.

JEREMYSQUAM, an island of America, in Lincoln county and state of Maine, which, with Folly island, forms the mouth of Sheepscott river, in Wicasset bay.

JERF, a town of Norwegian Lapland; 100 miles W.S.W. of Wardhuys.

JERPALF, the English name of the gyralfo, a very fierce, bold, and large bird, the largest of all the falcon kind. See Gyralf.

JERGUEER, in the Cylam Hufes, one who oversees the dwellings and conduct of the waiters.

JERICH, in Ancient Geography, a considerable city of Palestine, in the tribe of Benjamin, about six miles W. from Jericho, and 22 miles S. from Jerusalem. It was situated in a spacious plain, producing all sorts of fruits, especially palm-trees, whence it was called "the city of palm-trees." Jericho was the first city in Canaan taken by Joshua. (Josh. ii. 1, 2, &c.) in the year 1496 B.C., and burnt by special order. About 537 years afterwards, Hiel of Bethel undertook to rebuild it (1 Kings. xvi. 34); and on this occasion Vol. XVIII.
style of singing, were of the first clas, or above mediocrity; and when Lovattini quitted this country, he left a blank in the comic opera, which has never since been filled up to our satisfaction.

JERMUK, in Geography, a river of Syria, anciently "Hieromax," which runs into the lake of Tiberias, near its southern extremity.

JEROM, or JEROME, St., EUSEBIUS HIERONYMUS, in Biography, an eminent father of the Christian church, was born of Christian parents at Stridon, on the confines of Daotla and Pannonia, probably about the year 342; though others date his birth in 329, 330, or 331; and as he died in the year 420, they say that he was about 90 years of age when he died. Several circumstances corroborate the former statement, ascribed by Lardner as the era of his birth. He commenced his studies in grammar and other parts of literature at Rome, where he resided at the time of the emperor Julian's death. Donatus, the celebrated grammarian, was one of his preceptors; and his studies in logic and various branches of philosophy were directed by other teachers. His application and proficiency were very distinguished at an early period of life; and it appears that, during his residence at Rome, he cultivated the theory and practice of rhetoric, and laid the foundation of that extensive acquaintance with theology and ecclesiastical history, and also with the Hebrew language, in which he afterwards excelled. From Rome he removed to Gaul; and at Aquileia he formed an intimate acquaintance with Rufinus, a presbyter of that city. He afterwards returned to Italy, having collected, while he was in the western empire, a considerable library, in which to the progress of his life he made many valuable additions. From Italy he went into the East, where he spent several years, partly in the deserts of Syria, partly at Antioch, and partly at Constantinople. At Antioch he was ordained presbyter by Paulinus in 378; accepting the office on condition that he should not be confined to one church, or be drawn away from that monastic life which he conceived to be most favourable to the prosecution of his studies. On this kind of life he seems to have entered when he was 30 years of age; and though during a period of four years he enlarged his acquaintance, with the oriental languages, and with those branches of knowledge which allotted him in understanding and interpreting the scriptures, the austerities he practised had so impaired his health, that it became necessary for him to return to Antioch, in order to recruit his strength. The church at Antioch was at this time distracted by contending parties; but Jerome declined taking a decided part with either of them, till he had obtained a letter from Damasus, bishop of Rome, which determined him to espouse the cause of Paulinus. Having, after his ordination, which we have already mentioned, resided for some time at Bethlehem, he made an excursion from thence to Constantinople, with a view of deriving benefit from the instructions of Gregory Nazianzen, and from whom he learned, as he himself acknowledges, the right method of expounding the holy scriptures. In the year 385, he accompanied Paulinus, bishop of Antioch, and Epiphanius, bishop of Salamis in the island of Cyprus, to Rome; and here he was employed by pope Damasus, as his secretary, in conducting a variety of negotiations for extending the authority of the papal power. In the superintendence of a society of Roman ladies, who had renounced the world, and devoted themselves to a religious life, which Damasus advised him, he acquitted himself to the satisfaction of the pope; but not without incurring the displeasure of the friends and relations of those weak females, who abandoned their stations in civil society, and misapplied their wealth to the support of useless and pernicious institutions. He had likewise other enemies, who disapproved the freedom with which he reprehended the corrupt manner of the clergy, and the vices of the people. Another circumstance that rendered his situation at Rome unpleasant to him was the part he took in an affair with the followers of Origen, whom he had often condemned, and many of whose works he had translated into Latin, but whose peculiar opinions he now opposed as heretical. The Origenists were thus exasperated, and circulated some scandalous but unfounded reports of a disreputable connection with Paula, in whose house he lodged, and who afterwards, with her daughter, followed him to the East. (See EUSTOCHIUM.) Jerome, thus disquieted at Rome, determined to return to the East; and the death of Damasus hastened the execution of his purpose; and in 385 he embarked on board a ship bound for Antioch. From Antioch he went to Jerusalem, where he pretends to have been witness to a number of miracles, which have gained little credit either among Protestants or respectable Catholics. In Egypt he attended the lectures of the learned Didymus, and translated the monasteries in the desert of Nitria. In 385 he settled at Bethlehem, where he was received by Paulinus and various ladies who had followed him from Rome, as well as by many other persons of both sexes, who admired his piety, and who were attached to his strict discipline. At Bethlehem, Paula founded a church and four monasteries, one for men, which was committed to the superintendence of Jerome, and three for women, over which the herself presided. In this situation he employed his talents and learning to many useful purposes, in the education of several young persons of rank, and in the composition of various works, that reflect honour on his name and memory: and he might have been as happy as he was useful, if he had not indulged an intemperate detestation of the opinions of Origen, and engaged in numerous ardent contests with those who defended and propagated them. In 410 the monastery of Jerome afforded an asylum to many of those fugitives who sought relief in the Holy Land from the ravages of the Goths, who laid Italy waste, and besieged Rome; but Jerome was the unjustifiable bigot of his temper, that he excluded all who favoured the opinions of Origen from a share in his hospitality: At Bethlehem Jerome terminated his life in the year 420.

Few were inclined to dispute Jerome's title to the character of being the most learned of all the Latin fathers. This title is evinced by the testimony of the best judges, and by the numerous works of which he was the author. His judgment, however, was not sound and discriminating; nor was his reasoning periphrastic and accurate; and his style has been unjustly represented as more declamatory than argumentative. But the acrimony of his temper, and the total want of candour that appears in his controversial writings, throw a dark shade over all his other good qualities. "His complexion," says Motheim, "was excessively warm and choleric; his bitterness against those who differed from him extremely keen; and his thirst of glory insatiable. He was so prone to enrage, that several persons, whose lives were not only irreproachable, but even exemplary, became the objects of his unjust accusations." The learned Cave says, "he was a very hot and furious man, who exercised no command over his passions. When once provoked, he treated his adversaries in the roughest manner, and did not even abate from invective and fatere; witnests what he has written against Rufinus, who was once his friend. John of Jerusalem, Jovius, Vigilantius, and others. Upon those men,
when they gave him the flighest provocation, he poured forth a torrent of all the abusive terms which he could de-
vive, without any regard to their persons, dignity, or
learning. His behaviour to the Originitis; his declaration
principally respecting such, "we receive and entertain all
strangers without regard to merit; none are excepted but
herself," and his whole declaration in his controversy with
Rusinius, "let us but have the fame faith, and we are recon-
ciled," preclude the charge of want of candour, if we say
that Jerome would not have confined himself to the mere abuse
and invective of words, if he had been entrusted with power.
There is but a flip between flattering heretics in diftrefs, and
tying them to the flake. None can approve of the high
terms in which he extols celibacy and virginity, as to seem to
disparage the marriage flate; and of his culpable credul-
ity, we have ample evidence. The candid Lardiner, without
disinguishing or condemning the charges which have been al-
eged against him upon the bell authority by others, allows
him to bear testimony in his own favour, and he acquits him
from the imputation of vanity: thus he speaks of himself in
various passages collected from his works: "That he
had been from the beginning diligent and industrious;
that all his days he had been employed in the schools of
rhetoricians and philosophers, or in reading the fcriptures
of the Old and New Testament; that, beside Latin and
Greek, he had endeavoured to make himself master of He-
brew; that he did not rely upon his own judgment and
understanding in interpreting the fcriptures, but consulted
other commentators, and was willing to improve by their
labours; that he never thought himself too old to learn, but
embraced all opportunities of increasing in knowledge; that
he was not employed, as many monks were, in making
baskets of rushes, and flreen of palm-leaves, to get a livelihood,
but in studying the fcriptures, and putting out correct
editions of them."

Of all the productions of Jerome, the moft useful are his
interpretations of the feared fcriptures, and thofe of his
letters, which contain critical marks and diferences on
particular texts in the bible. The principal of his works,
which are enumerated by Cave and Dupin, are, a new Latin
version of the whole "Old Testament," from the Hebrew,
accompanied with a corrected edition of the ancient version
of the "New Testament," which, after having been at firft
much oppofed, was adopted by the Catholic church, and
is commonly diftinguifhcd by the appellation of "Vulgate,"
which fe; "Commentaries" on mot of the books of the
Old and New Testament; "A Treatife on the Lives and
Writings of Ecclelafrical Authors;" "A Continuation of the
Chronicle of Eufebius;" moral, critical, historical, and
miscellaneous "Letters." The firft printed edition of his
works was that at Bafi, under the care of Erafinus, 1516—
1526, in fix vols. folio, of which there have been feveral
fubfquent impreffions at Lyons, Rome, Paris, and An-
twerp. The moft correct edition is that of Paris, by Father
Martianay, a Benedictine monk of the congregation of St.
Maur, 1603—1706, in five vols. fol. Cave, H. L. vol. i.

In Jerome's works many particulars occur relative to the
muflc of his time, and the chants of the church, efpecially
in his commentary on the epitile to the Ephesians, ch. v.
ver. 19. p. 652, where there is a memorable passage in
favour of ecclefiafical finging: "Speaking to yourfelves in
piaims and hymns, and spiritual fongs, finging and making
melody in your heart to the Lord," cries out, "Adiant hac
adolescentuli: audiant hi qui quibus palentiis in ecclesia officium
efl, Deo non voce, sed corde cantandum: nec in Trague-
dorum modum guttur et fauces dulci medicamine collinien-
das, ut in ecclesia theatralis moduli auditur et cantica, fed
in timore, in opere, in scientia scripturarum."
and among other severe things he called that assembly the "school of the devil," and "a synagogue of bigness." The priests, incensed by this language, informed against him to the chief magistrates, by whom he was arrested and delivered into the hands of the duke of Sultzbach. The duke, having Jerome in custody, wrote to the council for directions; and he was desired to fend his prisoner immediately to Con-
fiance. The elector-palatine then met him, and conducted him in triumph to the town; himself riding on horseback, with a numerous retinue, who led Jerome, in fetters, by a long chain, after him. As soon as he was brought before the council, the clamour against him became loud and tu-
multuous; and among others, who disgressed themselves on this occasion, was John Gerion, chancellor of the university of Paris, one of the most learned, as well as the most knowing men of his time, but deftite of that candour which usually attends knowledge. In the chancellor's invective and re-
proach the rectors of the universities of Cologne and Hidel-
berg concurred; but Jerome had no opportunity of replyng.

A thousand voices burst out from every quarter, "Away
with him! burn him! burn him!" After an interval of about half an hour the tumult partly subsided; and J.rome,
availing himself of a momentary pause, looked round the
assembly with a noble air, and cried out aloud, "Since
nothing can satisfy you but my blood, God's will be done.'
He was then carried from the assembly into a dungeon, under
the custody of a guard. Whillt he was ruminating upon his
approaching fate in this cell, he heard a voice addressing him
in these words, "Fear not, Jerome, to die in the cause of
that truth, which, during thy life, thou hast defended." "Whoever thou art," replied the intrepid prisoner, dir-
ecting his eyes to the window from which the voice seemed
to proceed, "who deignest to comfort an abject man, I give
thee thanks for thy kind office. I have indeed lived defending
what I thought the truth: the hardest task yet remains, to die
for its sake; but God, I hope, will support me against faith
and blood." The guard was alarmed, and Maddonwitz, who had
rendered services to Hufs, was discovered to be the offender.
This incident was a pretence for a more severe treatment
of Jerome, who was immediately conveyed to a strong tower,
where, his hands being tied behind his neck, he was left to
 languish in that painful solitude for two days, without any
aliment besides bread and water. These severities were
inflicted with the design of forcing him to make a recantation;
and the ill effects which they occasioned, in the course of
which he urged the council to allow him a confessor, afforded
an opportunity of preying him with arguments to this purpofe.
Jerome, however, remained immoveable. A fimilar at-
tempt was made upon him immediately after the death of
Hufs; but he was still invincible. However, though he was
not to be subdued by the simple fear of death, imprison-
ment, chains, hunger, ficknefs, and even torture, through a
succession of many months, was too great a trial for
human nature. Three times was he brought before the
council, and carried back to the horrors of his dungeon,
before his enemies could prevail against him. At length he
began to waver; and on the 23d of September, a fatal day,
which he recolected with shame and grief, he read a loud and
ample recantation of all the opinions he had maintained,
concluded in words directed by the council. In this paper he
acknowledged the errors of Wickliff and Hufs, entirely af-
fectioned to the condemnation of the latter, and declared him-
self, in every article, a firm believer with the church of
Rome. Having thus acted against his confcienc, he re-
tired from the council with a heavy heart. His chains, in-
deed, were taken away; but the load was transferred from
his body to his mind. Vain were the careles of thofe about
him; they only mocked his sorrow. His prison was now
indeed a gloomy solitude. The anguish of his own thoughts
had made it fuch. Paletz and Du Cont, the chief ma-
grangers against him, foon perceived this change; and they
determined to bring him to a new trial. Several persons,
however, and particularly the cardinals of Cambrai and
Florence, objected to a new trial. But their endeavours
were ineffectual, a torrent of zeal and bigotry bore down all
opposition; and even the learned Gerion again difgraced himself
by joining in the tumultuous clamours; with great
indecency employing his pen, as well as his tongue, upon
this occasion. This kind of agitation continued for half a
year: fo that it was not till May in the year 1416, when
Jerome was called again before the council. The prospect
afforded him pleasure; and he rejoiced at an opportunity of
acknowledging publicly that shameful defecion, which hung
to heavyn upon him. The chief articles alleged against
him were, his adherence to the errors of Wickliuff—his having
had a picture of that heretic in his chamber, arrayed in the com-
mon ornaments of a fainit—his counterfeiting the fial of
the university of Oxford in favour of Wickliuff—his defpifing
the authority of the church after excommunication—and his
denial of tranubftantiation. Having protelted his innocence,
and given a circumjuntional detail of his coming to Confi-
cance, and of all that he had fene befallen him, he railed his
voice, and having expressed himself with some affery against his
accusers, he told them that he was going to lay himself
more open to them than he had yet done. He then, with
great emotion, declared before the whole assembly, that the
fear of death only had induced him to retract opinions which
from his heart he maintained: that he had done injufice to
the memory of those two excellent men, John Wickliff and
John Hufs; whose examples he revered, and in whose doc-
trine he was determined to die. He concluded with a fe-
vere invective against the clergy; the depravity of whom
manners, he said, was now every where notorious. His
speech produced a wonderful effect on the whole assembly;
and many wished that his life might be faved. His judges,
however, precipitated the paffing of fentence; and on the
fame day, or a few days after, he was condemned for having
held the errors of Wickliff, and for apotatizing. He was
then immediately delivered over to the civil power, and, at-
tired with a cap like that with which Hufs had been adorned,
he was led to execution. The poft to which he was chained
was hewn into a monstrous and uncouth figure of Hufs, and
ornamented into a ridiculous likeness of him. When
the wood began to blaze, he fang a hymn; and when the flames
fearched him, he was heard to cry out "O Lord God! I
have mercy upon me!" and a little afterwards, "Thou
knoweft how I have loved the truth." The wind parting
the flames, his body, full of large blisters, exhibited a dread-
ful pectacle to the beholders; his lips continued firm moving,
as if actuated by intense devotion. During a full quarter
of an hour, he discovered the figns, not only of life, but
of intellect. Even his enemies thought the rage of his
judges purfued him too far, when they laid his wretched con-
cerft, and the other miserable garniture of his prifon, by
their order, confufed in the fire after him; and his ashes,
as thofe of Hufs had been, thrown into the Rhine.

The celebrated Poggio of Florence was prent at the
trial of Jerome, and in a letter to his friend Leonard
Arcite, has given an interefting account of it. For the
whole letter we refer to Shepherd's life of Poggio Braccio-
lini, and for feveral extracts to Gilpin's life of Jerome.
"It was indeed amazing," says this celebrated writer, "to
hear with what force of expreflion, with what fluency of
language, and with what excellent reafoning he anfwered his
adverfaries;
adversaries; nor was I less struck with the gracefulness of his manner; the dignity of his action; and the firmness and constancy of his whole behaviour."—"Here," said Jerome, as cited by this writer, standing in the midst of the assembly, "here is justice; here is equity. Defeat by my enemies; I am already pronounced a heretic; I am condemned, before I am examined. Were you God's omnipotent, instead of an assembly of fallible men, you could not act with more sufficient. Error is the lot of mortals; and, you, exalted as you are, are subject to it. But consider, that the higher you are exalted, of the more dangerous consequence are your errors. As for me, I know I am a wretch below your notice; but at least consider, that an unjust action, in such an assembly, will be of dangerous example."

When Jerome was accused of hating and defaming the holy see, the pope, the cardinals, the prelates, and the whole estate of the clergy, he stretched out his hands, and said, in a most moving accent, "On which side, reverend fathers, shall I turn for redress? whom shall I implore? whose assistance can I expect? which of you hath not this malice, this charge entirely alienated from me? which of you hath it not changed from a judge into an inveterate enemy? It was artfully alleged indeed! Though other parts of their charge were of less moment, my accusers might well imagine, that if this were fastened on me, it could not fail of drawing upon me the united indignation of my judges."

On the third day of this memorable trial, what had passed was recapitulated; when Jerome, having obtained leave, though with some difficulty, to speak, began his oration with a prayer to God; whose divine assistance he pathetically implored. He then observed, that many excellent men, in the annals of hiltory, had been oppressed by false witnesses, and condemned by unjust judges. Beginning with profane history, he inculcated the death of Socrates, the captivity of Plato, the banishment of Amazogoras, and the unjust sufferings of many others. He then alluded the many worthies of the Old Testament, in the same circumstances, Moses, Joshua, Daniel, and almost all the prophets; and lastly those of the New, John the Baptist, St. Stephen, and others, who were condemned as seditious, profane, or immoral men. An unjust judgment, he said, proceeding from a laic was bad; from a priest, worse; still worse from a college of priests; and from a general council, superlatively bad. These things he spoke with such force and emphasis, as kept every one's attention awake.

The perjured witnesses," said Jerome, "who have appeared against me, have won their cause; but let them remember they have their evidence once more to give before a tribunal, where falsehood can be no disguise."

"His voice," says Poggio, "was sweet, distinct, and full: his action every where the reverse, either to express indignation, or to raise pity; though he made no affected application to the passions of his audience. Firm and intrepid he stood before the council; collected in himself; and not only concerning, but seeming even defirous of death. The greatest character in ancient story could not possibly go beyond him. If there is any justice in history this man will be admired by all posterity. I speak not of his errors: let these roll with him. What I admired was his learning, his eloquence, and amazing acuteness. God knows whether these things were not the ground-work of his ruin."

"With a cheerful countenance, and more than Stoical constancy, he met his fate; fearing neither death itself, nor the horrible form in which it appeared. When he came to the place, he pulled off his upper garment, and made a short prayer at the stake: to which he was soon after bound, with wet cords, and an iron chain; and included, as high as his breast with faggots."

Obeying the executioner about to let fire to the wood behind his back, he cried out: Bring thy torch lighter. Perform thy office before my face. Had I feared death, I might have avoided it."

"As the wood began to blaze, he sang a hymn, which the violence of the flames fearfully interrupted."

"Thus died this prodigious man. The epitaph is not extravagant. I was myself an eye-witness of his whole behaviour. Whatever his life may have been, his death, without doubt, is a noble lesson of philosophy." See BRACCIOLINI.

JEROME DE SANTA FÉ, a learned Spanish Jew in the fifteenth century, whose original name was Joshua Larchi. He became a Christian, and upon his baptism changed his name for that under which he has been just described. He was physician to Peter de Luna, who was chosen pope by the cardinals at Avignon in opposition to Boniface IX., and took the name of Benedict XIII. When this pontiff was in Spain, in the year 1412, he ordered a public conference to be held between some learned Christians at Tortosa, and the most celebrated Jewish rabbis in Arragon and Catalonia, on the subject of the Messiah's character, and the evidence brought forwards to prove that Jesus of Nazareth was that person; on this occasion Jerome acquitted himself with credit to his own learning and abilities, and to the new faith which he had embraced. In the following year he presented to the pope a treatise in confutation of the errors of the Jews, and another against the Talmud, which are said to have produced such an impression upon the Jews, that more than five thousand became Christians. They were published at Frankfort under the title of Hebrew-magilis, in the year 1402.

JEROME'S CHANNEl, ST., In Geography, an inlet in the straits of Magellan, which branches off to the N.N.W. about 20 miles in length, forming a communication between the Straits and Indian found.

JEROME'S POINT, ST., a cape on the coast of Patagonia, in the straits of Magellan, forming the W. point of entrance into St. Jerom's channel; 11 miles E. of cape Quad.

JERONIMO DE TAOS, ST., a town of New Mexico, on the Brava; 62 miles N. of Santa Fé.

JERONYMITES, or HIERONYMITES, a denomination given to divers orders, or congregations of religious; otherwise called Hermits of St. Jerom.

The first, called Hermits of St. Jerom of Spain, owe their origin to the third order of St. Francis, whereof the first Jeronymites were members. Gregory the eleventh confirmed this order under the name of St. Jerom, whom they had chosen for their patron, and their model; and gave them the constitutions of the convent of St. Mary of the Sepulchre, with the rule of St. Augustine; and for habits, a white tunic, with a scapulary, a little cap, and a mantle, all of their natural colour, without dying, and of a mean price.

The Jeronymites are in possession of the convent of St. Laurence, in the Escurial, where the kings of Spain are buried.

In Spain there is likewise an order of nuns of St. Jerom, founded by a lady towards the close of the 15th century. Sixtus put them under the jurisdiction of the Jeronymites, and gave them the constitutions of the monastery of St. Martha of Cordova, which were afterwards changed by Leo X. for those of the order of St. Jerom.

Hermits of St. Jerom, of the Observance, or of Lombardy, were founded by Lupus d'Olmedo in 1424, in the mountains of Cazalla, in the diocese of Seville.
The third order of Jeronymites was founded by Peter Gambacorti, about the year 1377; but the vows they made were only simple, till 1598, when Pius V. appointed them to be solemn. They have houses in Tyrol, Italy, and Bavaria.

The fourth congregation of Jeronymites, are the Hermits of St. Jerome of Fiesole, begun in 1565, when Charles de Montemagno, of the family of the count of that name, retiring into solitude, first established it at Verona. It was approved by Innocent VII. under the title and constitutions of St. Jerome. But Eugenius IV. changed it for that of St. Augustine. As the founder was of the third order of St. Francis, they preferred that habit; but, in 1460, Pius, permitting such as pleased to change it, occasioned a division among them. This order was finally suppressed by Clement XI. in 1668.

JEROPOTAMO, in Geography, a river of Candia, anciently "Lathseus," which runs into the Mediterranean, 8 miles N.N.W. of Cape Metaia.

JERSEY, an island in the British Channel, N. lat. 49° 25', W. long. 2° 11', situated about four leagues from the coast of Normandy, and 25 from that of England. It is considered as belonging, in statute law, and comprises an area of 12 miles in length by fix in breadth; forming about 72 square miles, English measure. The island is divided into 12 parishes (having only eight churches), subordinate to the see of Winchester, and contains the two towns of St. Helier's and St. Aubin's. The population of the isle amounts to about 26,000, of which 3000 are able to bear arms, and are formed into two regiments. The shores abound with rocks and quickfands. On the northern side the cliffs are from 40 to 50 fathoms in height; but the southern shore is nearly level with the sea. A mountainous range runs through the centre, the sides of which abound with orchards; from the produce large quantities of cyder are made annually. It is computed that 24,000 hogheads have been made in one year. This propensity of the inhabitants for cyder has occasioned them to convert their arable lands into orchards; and hence they have been obliged to import corn from the Baltic, England, and, in times of peace, from France. Formerly they raised enough, not only for home consumption, but for exportation. An abundance of cattle and sheep are reared here; and native wool forms an important article for trade and manufacture. There were formerly five monastic foundations in the island. All the accessible parts of the coast are well fortified with batteries, watch towers, &c. The latter have embrasures for small cannon, and loopholes for musketry. St. Aubin's bay is guarded by two very strong castles, or forts. These, and the whole military government of the island, are under the control of a governor, an officer nominated by the English ministry. The civil jurisdiction is vested in a bailiff and 12 jurors, who are regulated by local laws chiefly derived from the ducal customs of Normandy. Jer-f-y, Guernsey, Sark, and Alderney, were formerly part of the duchy of Normandy; and, though now united to the British crown, still preserve many Norman customs and laws. The legislature of England cannot enforce any law here unless it has previously been sanctioned by the bailiff and jurors. Some of the Jersey merchants employ several vessels in the Newfoundland trade. The French language is generally spoken here, and this is mostly used both in the pulpit and at the bar. Elizabeth castle, the principal fort of the island, was begun by queen Elizabeth, and hence its name. King Charles I. enlarged it; and king Charles II. who was twice here, inclosed and completed it. The governor and garrison now reside here, and the whole occupies an island in St. Aubin's bay. Mount-Orgueil
castle was a place of strength before Henry the Fifth's reign, and was a fortress of very considerable confluence in the time of Edward III. This was also strengthened by queen Elizabeth. It stands on an eminence which is ascended by 200 steps. From the top may be seen the cathedral of Canterbury. This island is said to have abounded with Druidical temples and altars. Bindaxtro, who wrote some tracts concerning Jersey, and died in 1691, states, that there were not less than 50 of these temples and altars in the island, of which the greater part were destroyed when Falle wrote his history. The Cromlechs are here called Poukeleys. In Camden's Britannia, vol. iii. p. 751, edit. 1789, is an extract of a letter from Mr. Morant to Dr. Stukeley, giving an account of several of these remains; and in Grose's Antiquities is a particular description, with two plates, of a very singular circular temple, which was found covered over with earth near the town of St. Hellen. This was removed to Park Place, Berkshire, by general Conway, who was governor of the island when it was found.

In January 1781, the French, under baron de Rullicourt, landed here, and took possession of the garrison, the governor of a fort in command, attacked the French, and so operate was the conflict that both of the commanders were killed, but the invaders were compelled to surrender as prisoners of war. Falle's Account of Jersey. Camden's Britannia. Grose's Antiquities of England.

JERSEY, New, one of the United States of America, situated between 39° and 41° 24' N. lat. and between the meridian of Philadelphia and 1° E. long.; and bounded E. by Hudson river and the sea; S. by the sea; W. by Delaware bay and river, which divides it from the states of Delaware and Pennsylvania; N. by a line drawn from the mouth of Mahacka-mak river, in lat. 41° 24' to a point on Hudson river in lat. 41°. This province is 160 miles long and 52 broad, and contains about 8220 square miles, or 5324,800 acres. It is said to have been first discovered by capt. Hudson, who, in 1609, entered into the service of the Dutch, by whom it was first settled, about the year 1614. Its original inhabitants were a tribe of Indians, who called themselves Linnellinopies; by the French they were denominated Les Loups, and by the English, Delaware. This confederacy comprised numerous subordinate clans, of which the principal were the Chihocki, who dwelt on the W. side of the river Delaware; the Wanami, who ranged from the Raritan in New Jersey to the sea-coast; the Munneys, on the upper streams of the Delaware, down to the Lehigh; the Wabingas, or river Indians, who resided between the Delaware and Hudson, and from the Kittatany to the Raritan; and the Mohickons or Mannkatts, who occupied Staten island, York island, and part of Long island, from the highlands to the ocean. These confederate tribes waged war for the greatest part of a century with the Iroquois, or five nations, but were at last subdued, and reduced to the most humiliating terms, about the year 1682, when William Penn landed in Pennsylvania.

This province formed a part of a large tract of country called New Belgium, or New Netherland; and being ceded to the English, it was granted, in 1664, by Charles II. to his brother James, duke of York, who made it over to Lord Berkeley and Sir George Carteret. After several divisions and transfers, which were sources of quarrels and confusion, the proprietors, in the year 1702, surrendered their charter to the crown, and the country was united to the government of New York. In 1706 Jersey was made a separate government. New Jersey is now divided into 15 counties, which are subdivided into 94 precincts or townships, as in the annexed table:

TABLE.
The militia of this state in 1793 amounted to 19,677, between the ages of 18 and 45 years; and the whole number of men capable of bearing arms amounted to between 30 and 40,000. The government of this state is vested in a governor, chosen annually by the council and assembly jointly, a legislative council composed of one member from each county, chosen annually by the people and general assembly, composed of three members chosen as above. The governor sits in and presides over the legislative council; his privy or executive council consists of any three members of the legislative council; and the governor and any seven members of the council are a court of appeal in the last resort as to points of law in civil cases, and posses a power of pardoning criminals in all cases whatever. The council may originate any bills, excepting preparing and altering any money bill, which is the sole prerogative of the assembly. Every bill is read three times in each house. None of the judges of the supreme court, or other courts, sheriffs, or any person possessing any poll of vote under the governor, justices of peace excepted, is entitled to a seat in the assembly. The courts of justice in this state are justices' courts, courts of quarter-seances of the peace, courts of common-pleas, supreme courts, orphans' courts, courts of chancery, and high court of errors and appeals. The English laws, as far as they are not repugnant to revolution principles, are adopted by the constitution; but in the distribution of property, where there is no will, each son has two shares, and each daughter has one share. In this state there are about 50 Presbyterian congregations, subject to the care of three presbytries: viz. those of New York, New Brunswick, and Philadelphia. Besides these there are upwards of 40 congregations of Friends, 30 of the Baptists, 25 of Episcopalians, 28 of Dutch Reformers, 20 of the Methodists, and a settlement of Moravians. All are allowed by the constitution to worship God according to the dictates of their own consciences; and are not compelled to attend or support any worship contrary to their own faith and judgment. All Protestant inhabitants, of peaceable behavior, are eligible to the civil offices of the state. For the colleges in this state, see College. The capital town of this province is Trenton; besides which there are Burlington, Perth Amboy, Brunswick, Elizabeth-town, Newark, Swedesborough, Salem, &c. which see respectively. The rivers in this state, though not large, are numerous; the principal are the Passaic, Rahway, Hackinkuck, Delaware, Cohaneck creek, Mullicus, Alloway creek, Ancous creek, Paulins's Kile, Raccoon creek, Salem creek, and some others. This state is remarkable formill-fafts, 1,100 of which are already improved; 500 with flour-mills, and the rest with saw-mills, fulling-mills, forges, furnaces, flinting and rolling-mills, paper, powder, and oil-mills. The greatest part of the soil of New Jersey is sandy; some of it barren and unfit for cultivation; but that near the sea-coast is said to be many feet deep, in some places 50, without rocks or stones, when you come to salt-marsh, and has much the appearance of being artificial; the good land in the southern counties lies principally on the banks of rivers and creeks; the soil on these banks being generally a stiff clay, which, in its natural state, produces various species of oak, hickory, poplar, chestnut, &c. The barren parts produce little else but shrub-oaks and yellow pines. These sandy lands yield an immense quantity of bog-iron ore, which is wrought very advantageously in the iron-works in these counties. The salt meadows along the lower part of the Delaware river and bay afford plentiful pasture for cattle in summer, and hay in winter; but the swarms of muskites in the months of June, July, and August, are very troublesome both to man and beast. The inhabitants along the sea-coast furnish principally by feeding cattle on the salt-meadows, and by various kinds of fish, abundantly supplied by the sea, rivers, and creeks. They raise Indian corn, rye, potatoes, &c. but not for exportation. Their swamps afford lumber, which is conveyed with ease to a good market. The sugar maple-tree is common in Sussex county, upon the Delaware. In the lilly and mountaneous parts of the state, which are not too rocky for cultivation, the soil is of a stronger kind,

</table>
kind, covered, in a state of nature, with flatly oaks, hickories, chestnuts, &c. and when cultivated, producing wheat, rye, Indian corn, buck wheat, oats, barley, flax, and fruits of all kinds common to the climate. The land in this hilly country is good for grazing, and farmers feed great numbers of cattle for the markets of New York and Philadelphia; and many of them keep large dairies, as there are large tracts of fine meadows between the hills. The orchards in many parts of the state are said to be equal to any in the United States, and the cider is reckoned the best in the world. Tho' parts of New Jersey that are contiguous to New York and Philadelphia, supply their markets with many kinds of vegetables, as apples, pears, peaches, plums, strawberries, cherries, and other fruits; cider in large quantities, and of the best quality, butter, cheese, beef, pork, mutton, and other meats.

The trade of New Jersey is carried on almost solely with New York and Philadelphia; though it has some good ports of its own. The articles exported are chiefly wheat, flour, hores, live cattle, hams which are much commended, lumber, flax-feed, leather, iron in great quantities, and formerly copper-ore. The imports consist chiefly of West Indian goods. The manufactures of this state have been considerable, though they are now improving; and they consist principally of the articles of iron, nails, and leather. Tobacco is numerous and valuable; paper-mills and nail manufactories are worked with profit in several parts of the state. Wheat is also manufactured into flour, and Indian corn into meal; and there are profitable articles. But iron is the most ample source of wealth to the state. Iron-works are erected in Gloucester, Burlington, Suffolk, Morris, and other counties. In the whole state it is supposed there are yearly made about 1200 tons of bar-iron, 1200 ditto of pigs, and 80 ditto of nail-rods, exclusive of hollow ware, and various other callings, to a great amount. This state affords vast quantities of iron and copper-ore. The iron-ore is of two kinds: one capable of being manufactured into malleable iron, and found in mountains and low barren; and the other called bog-ore, found in rich bottom, and yielding iron of a hard, brittle quality, which is commonly manufactured into hollow ware, and used sometimes instead of stone in building. Many copper-mines have been discovered in different parts of the state. Mines have also been discovered of lead and plaster of Paris, and the state is paid also to contain coal. In the town of Newark and its vicinity, there are immense quarries of valuable stone, much used in building.

The inhabitants of this state are a collection of Low Dutch, Germans, English, Scotch, Irish, and New Englanders, or their descendants; and of course differ much in their manners and character; and this difference is in some measure increased by different forms of religion, and also by intercourse with the inhabitants of other states. The people in West Jersey trade to Philadelphia, and incline to the fashions and manners of that city; whilst those of East Jersey trade to New York, and acquire a resemblance to the inhabitants of this capital. But whatever differences may subsist among them in consequence of these circumstances and of their different occupations and professions, the people of New Jersey are generally industrious, frugal, and hospitable. The women are allowed to be different, amiable, genteel, and also handsome, in the proportion to their whole number. Morse's American Universal Geography, vol. i. 1805.

JERSEY, New, in Botany. See Ceanothus.

Jersey, among Woolcombers, denotes the finest wool, taken from the reed by dressing it with a Jersey comb.

JERTH, in the Materia Medica, a name given to a certain kind of moss, according to Schaffner, growing very plentifully in Lapland, and other cold countries. The root of this is the part used in medicine, and the method of giving it is in decoction. They boil a large quantity of it in the whey made of rein-deer's milk, and give the patient large draughts of it warm every hour or two; by that means keeping up a good perspiration, which they increase or diminish according to the nature of the case. The principal diseases to which they are subject are pleurisy and the small-pox; and it is wonderful to find how well they get through these two dangerous complaints by this regimen alone. Upon the whole, the virtue of so much warm and diluting liquor seems the principal thing to be depended upon by them; for if they cannot readily get the jezth root, they frerul not to supply its place with the flakes of angelica, and the medicine seems to succeed as well this way as the other, both in the small-pox and other cases.

JERVAS, Charles, in Biography, a portrait painter, whose name is more indebted for its reputation to his pupil Pope having offered falle incense to him in a copy of veres, than to his own merits. He was a pupil of Kneller, and acquired a fortune by marriage. He died in 1739.

JERVISY'S Canal, in Geography, an inlet or arm of the Pacific ocean, on the W. coast of North America, in the gulf of Georgia, examined and so named by captain Vancover in the year 1792. N. lat. 49° 42'. E. long. of the entrance 235° 22'.

JERUSALEM, derived from יִשְׁרָאֵל, to war, and יִשְׁרָאֵל, peace, g. f. the vition or inheritance of peace, a celebrated city of Asia, the capital of Palæstine or Judea, is supposed, though perhaps without sufficient authority, to have been built on the site of Melchizedek's Salem, and hence called "Salem" and "Solyma." It was situated in the midst of a rocky and barren country, on the frontiers of the two tribes of Benjamin and Judah, so that it was sometimes considered as a part of the one, and sometimes of the other; but by the distribution of Joshua (ch. xviii. 28.) it belonged to Benjamin, whereas it pertained to Judah by right of conquest, this tribe having twice subdued it, first under the Judges, and afterwards under David. After the building of the Temple, it was considered as the metropolis of the nation, belonging to all Israel in common, and not properly either to Benjamin or Judah. Jerusalem was founded upon hills, and surrounded by mountains: the two largest hills were Zion and Acra, upon which the first buildings were erected; and on mount Moriah, Solomon, at a subsequent period, built the temple. Mount Zion bounded to the south the whole circumference, and reached from east to west: the western side was the most elevated, and circumfered by the valley of Hinnom, or Gethseman, as the eastern was by that of Jehosophat, which is supposed to have joined the other towards the south. Here were the fountains of Gihon and Siloam, the brook Kidron, and the waters of Ethan, which Pilate, at a much later period, conveyed through aqueducts into the city. To the north of Zion was another valley, called by Josephus "the valley of Cheesemongers," probably the same as that distinguished in Zephaniah (ch. i. 11.), by the epithet "Machneheth," which the LXX have translated to κατακανθον, g. d. that which was cut in or made hollow. Acra, with the fall valley to the south, flood to the north of Zion, having its declivity on every side equal. Upon Zion flood the High city, called, in the time of Josephus, the High Market-place; the Lower city flood upon Acra, but before that period bore other names. The ancient city Jebus, which David took from the
JERUSALEM.

the Jebusites, was not large: it stood on a mountain S. of the temple. When David subdued and expelled the Je-
butites, he fortified and made it city, B. C. 1038, and
called the latter after his own name, "the City of David." Between the mountains, Zion and Acra, on which the
Upper and Lower cities were erected, there was a valley,
which separated the two cities, but which was filled up by
David and Solomon, so that the two cities were joined.
1 Kings, ix. 15. 24. xi. 27.

Jerusalem, in its most flourishing state, was divided
into four parts, each inclosed within its own wall; namely,
the old city of Jebus, which stood on Mount Zion, where
the prophets dwelt, and where David built a magnificent
castle and palace, which became the residence both of
himself and his successors; on which account it was emphatically
styled "the City of David." The "Lower City," called
also the "Daughter of Zion," being built after it, on which
stood the two magnificent palaces which Solomon built for
himself and his queen; that of the Maccabean princes;
and the magnificent amphitheatre built by Herod, capable of
containing 80,000 spectators; the strong citadel by Antiochus,
to command the temple, afterwards razed by Simon the
Maccabees, who recovered the city from the Syrians; and
lastly, a second citadel, built by Herod, upon a high
and craggy rock, called by him Antonia. The "New City,"
mostly inhabited by tradesmen, artisans, and merchants;
and Mount Moriah, on which stood the celebrated
temple of Solomon, desecrated in the 6th and 7th chapters
of the 2d book of Kings, destroyed by Nebuchadnezzar,
rebuilt by the Jews on their return from Babylon, and
afterwards renewed, adorned, and enriched by
Herod. See Temple.

Little is said concerning the walls of Jerusalem. We
read, however, that after David had taken "the strong
hold of Zion," he called it the city of David, and dwelt in
that fort, having built round about Miilus and inward.
Solomon, from whose time the appellation of Jerusalem seems
to have superseded that of Jebus, and his successors, took
care to improve the walls. Hezekiah built up that part
which was demolished by Josiah, king of Israel, and added
another without. After the reign of Manasseh, there is
mentioned a new city, called the "Second," inclosed with
walls by that prince. (2 Chron. xxiv. 2. xxvii. 14.
2 Kings, xxii. 24.) The Maccabees considerably enlarged
it on the north, by inclosing a third hill, as part of Jerusalem.
Josaphus speaks of a 4th hill, called "Bezetha," which
Agrippa joined to the city: this new city lay north of
the temple, along the brook Kidron, or Cedron. In ancient
Jerusalem there were ten gates, five from W. to E. by S.,
and five others by N. Nehemiah mentions also four towers.
It is not easy to ascertain the extent of this city in its
different changes. Its most ancient rate of perfection was
in the reign of Solomon, in whose time this city appeared in its
greatest splendour. In this rate of uncertainty about its
limits, we may venture to state its circumference at first
not to have been more than 33 stadia, or Roman mile. In Solomon's
time it was, without doubt, twice or three times as large.
After the captivity, when it was rebuilt, it occupied much
the same space as before, as we may infer from Nehemiah's
description of the ruins, and its condition after it was re-
paired. According to Josephus, the whole circumference of
Jerusalem was 33 stadia, or about four miles 125 paces.
But Hecataeus, who describes it as it was in his time, under
Ptolemy Lagus, gives it no less than 50 stadia, probably
including the out-parts, which did not properly belong to it;
and Hecataeus adds, that there were in Jerusalem 120,000
inhabitants; which statement is not improbable. The cir-
cumference of the ancient city, according to Eusebius,
(Prap. Evan. 1. ix. c. 36.) was 27 stadia, or 2550 toises.
A plan, says Gibbon, taken on the spot, assigns no more
than 1980 for the modern town. For the different opinions
respecting its measurement, we refer to Villalpandus and Re-
land.

From the period of the reign of Solomon, when the temple
was dedicated, B. C. 1004, to the destruction of the city, it
underwent many revolutions and vicissitudes; some of the
principal of which we shall recite. In the fourth year
of the reign of Rehoboam, son of Solomon, B. C. 971, the
city was besieged and taken by Shishak, or S fec, king of
Egypt, who carried away the treasures of the temple, as well
as of the royal palace. In about a century after, B. C.
826, Jehoash, king of Israel, advanced to Jerusalem, hav-
ing taken Amaziah, king of Judah, and plundered the
temple and royal palace, and demolished the city-walls.
(2 Kings, xiv. 13. 2 Chron. xxv. 23.) In the year B.
608, Pharaoh Necho, king of Egypt, having slain Josiah,
knight of Judah, captured his son Jehoahaz, who had been
raided to the throne in the room of his father, imposed upon
Jehoiakim, appointed by Necho as his successor, a tax of 100
talents of silver, and 10 of gold, pillaged the city and temple,
and thus made Jerusalem tributary to Egypt. In the 4th
year of Jehoiakim, B. C. 606, Nebuchadnezzar besieged
Jerusalem, which now fell under the dominion of the Chal-
dees. When Jehoiakim attempted three years after
and against him, who defeated Judea, took
Jeboahinim, who succeeded him, reigned at Jerusalem only three
months. Nebuchadnezzar laid siege to Jerusalem, and
compelling Jehoiachin to surrender, carried him, his family,
and many of the inhabitants captive to Babylon. Upon this
occasion Nebuchadnezzar feized on all the riches of the
temple and royal palace, and destroyed those golden vessels
which Solomon had appropriated to the service of God.
In the room of Jehoiachin, Zedekiah was raised to the throne;
but when this prince rebelled against the king of Chaldea,
he sent an army against Jerusalem, which, in the 11th year
of Zedekiah, B. C. 588, took the city, and, after putting
out his eyes, carried him away as a captive. Nebuchad-
nezzar, being then at Kiblah, a city of Syria, sent his
general Nebuzaradan utterly to destroy Jerusalem. The
walls of the city were razed, the royal palace and temple
were demolished, their riches and ornaments transported
back to Babylon, and the people were carried away into slavery.
Cyrus, king of Persia, having conquered Babylon in the
year B. C. 538, set the Hebrews at liberty, and in the
year B. C. 536, issued an edict for their return to their
own land, for a restoration of the sacred vessels carried away
by Nebuchadnezzar, and for the rebuilding of their temple,
after a captivity of 70 years, if we reckon from the fourth
year of Jehoiakim, B. C. 606. (See Captivity.) The Jews,
obstructed by the Samaritans, and other hindrances, were
in years employed in constructing this new edifice, so that
it was finished in the year B. C. 516. But the walls and
gates were not rebuilt till after the return of Nehemiah, in
the space of 12 years and four months, the 82d year after
the decree of Cyrus, or B. C. 454. After the time of Ne-
emiah, Jerusalem enjoyed peace till the year B. C. 332, when
Alexander, having taken Tyre, demanded allegiance of the
Jews; and being refused by the chief priests, who pleaded
it as an oath made to Darius not to take part with his enemies,
the conqueror was incensed, and repairing to Jerusalem,
determined to be revenged on the city and its inhabitants;
but
but being met by a multitude of people drest in white, the priests arrayed in their robes, and the high priest in a garment of purple and gold, having on his head a tiara, with a plate of gold above it, upon which was inscribed the name of the Lord, his passion subsided; and approaching the high priest, he offered his adoration to God, and paid his respects to Jaddua, and saluted all the Hebrews. After the death of Alexander, Jerusalem remained subject to the kings of Egypt; Ptolemy Soter, the son of Lagus, having taken it by stratagem in the year B.C. 325, and having carried into captivity about 100,000 persons. In the year B.C. 170, Antiochus Epiphanes besieged Jerusalem, pillaged the city and temple, put to death 80,000 of the inhabitants, made 40,000 of them slaves, and sold 40,000 more. Three years after, the facricies were interrupted in the temple, the statue of Jupiter Olympus was placed on the altar, and the abomination of desolation was seen in the house of God. After three years, Judas Maccabaeus went up to Jerusalem, purified the temple, and restored the facricies. In the following year B.C. 164, Antiochus Eupator laid siege to Jerusalem, but a peace being concluded, he was received into the city by Judas Maccabaeus; however, he violated his oath, and cursed the wall between the temple and the citadel, which defended the former from the attacks of the Syrians, to be utterly demolished. In the year B.C. 143, Simon Maccabaeus fortified Jerusalem, by erecting high and strong towers on the walls; and he took and destroyed the citadel, which was then in the hands of the Syro-Macedonians, and which had kept Jerusalem 26 years dependent on the king of Syria. John Hyrcanus succeeded his father Simon in the year B.C. 135, and soon after Antiochus Sidetes, king of Syria, declared war against him, besieged Jerusalem, destroyed the walls of the city, and then retired. In the year B.C. 63, Pompey, having subdued Syria, laid siege to Jerusalem, and made Judea tributary to the Roman empire. But though he and some of his officers entered into the most holy places of the temples, they took nothing away. During the reign of Herod the Great, Jerusalem was much enlarged and embellished. He constructed a superb royal palace, a theatre, and an amphitheatre, for the purpose of celebrating various games in honour of Augustus. He also projected the design of rebuilding the temple, or at least of enlarging that which had been erected after the return of the Jews from the Babylonish captivity, and having begun the work in the 18th year of his reign, he completed it in eight years. (See Temple.) Under the reign of the emperor Tiberius, Jerusalem was made signal in all future ages by the death and resurrection of our Lord and Saviour Jesus Christ, who was unjustly accused and condemned, and crucified on mount Calvary. (See Calvary.) It is needless to recite any of those trivial circumstances that pertain to this city, between the event now mentioned, and its destruction by Titus. The country of Judea, and Jerusalem in particular, had been reduced to a wretched state by contending factions, and by reliance to the oppression of Roman governors. The diffatisfaction that prevailed at length terminated in the desolation and carnage of war. This was commenced, according to Josephus, (Ant. l. 20. xi. 1.) in the second year of the government of Gessius Florus, who succeeded Albinus, the successor of Porcius Festus, mentioned in the Acts of the Apostles, in the month of May, in the 12th year of the emperor Nero, and the 17th year of Agrippa, mentioned Acts, xxv. and xxvi, that is, in the month of May, A.D. 66. The emperor Nero entrapped the conduct of it, on the part of the Romans, to his general Vespasian, who, accompanied by his son Titus, and a powerful army, arrived in Syria, A.D. 67. Vespasian, soon after succeding to the empire, committed the prosecution of the war against the Jews to his son Titus, who joined the army, amid the acclamations of the populace, A.D. 70. Jerusalem was in the most woeful condition when Titus undertook the siege of it, April 14th, A.D. 70. Having made himself master of the first wall, May 4th, he cauaged a great part of it towards the north to be demolished. His favourable offer of terms to the besieged was rejected; and five days after he took the second wall, and after a repulse, he gained possession of it again in four days, and demolished the part that remained of it in the northern quarter. Failing to batter down the third wall, Titus renewed his proposal to the inhabitants, and for this purpose employed Flavius Josephus, who had been taken prisoner, and who, after having received his liberty, had attached himself to the Roman camp. The majority of the people were inclined to accept the easy conditions that were proposed; but they were refit by some zealots, and Josephus was treated with every mark of indignity and reproach. Titus was enraged, and his clemency was changed into unjustifyableseverity. He ordered the hands of those who had fought shelter in his camp to be cut off, and in this mutilated state sent them back to the city; and others were crucified in the sight of their countrymen. Within the city famine began to make dreadful havoc, and parents were obliged to satisfy their hunger by devouring the flesh of their own children; an action which appeared so unnatural to the Roman general, that he feared he would bury the remembrance of it under the ruins of Jerusalem. Titus accelerated by all the means in his power the operations of the siege, and at length, applying his battering rams to the third wall, or the wall enclosing the forterfs, he made himself master of the tower of Antonia. The Romans wished to get possession of the temple without destroying it; but a soldier threw a burning torch among a quantity of combustible materials in the northern part of it, and thus lit it on fire. The temple was burnt on the 15th day of the month of August, A.D. 70, the same day and month, on which it had been burnt by the king of Babylon. The Romans with concen, and the inhabitants with the most poignant sorrow, perceived this building reduced to ashes; and very soon, viz. on the 8th day of September, A.D. 70, and in the 2d year of the reign of Vespasian, the city of Jerusalem fell into the hands of Titus. It was then given up to be plundered by the soldiers, and most of its inhabitants were put to the sword. In conformity to the orders of Titus, the city was destroyed to its foundations, and even the ruins of the temple were demolished. A plough-share, it is said, was drawn over the consecrated ground, as a sign of perpetual interdict. According to Josephus, whose account of the Jewish war, and of the siege and capture of Jerusalem, is in almost every one's hands, the number of prisoners taken during the whole war was 97,000, and that the number of those who perished in the siege amounted to 1,100,000; but Tacitus, who lived in the 1st century, in the time of Vespasian and Titus, heard it reported, that the number of the besieged, including those of every age and sex, was only 66,000. Not withstanding the destruction of their city, many Jews remained in the town or in its vicinity, and erected new buildings for their accommodation; but they paid tribute to the Romans, and became subject to their laws. It is a circumstance that deserves to be recorded, that, as we have good reason to believe, no Christians were involved in the miseries of the last siege of Jerusalem. They are supposed to have left it before the siege began. Some went to Pella, as Eusebius mentions (H. E. i. iii. c. 5), a city on the other side of the Jordan. Others might go elsewhere, into Aila, or other
other remote countries, where they could get a settlement. St. John, it is supposed, left Judea, and went to Ephesus in the year 66, or about that time, just before the war commenced. Some Jews of Jerusalem, and other parts of Judea, might go with him, or follow him afterwards. And, under his direction and affliction, they might procure a comfortable settlement in places not far from him. After the termination of the war in Judea, it is supposed that the Christian believers, who had retired into the country beyond Jordan, returned to Jerusalem, and formed a church there.

In process of time, the Jews incensed Adrian by their turbulent disposition, and he resolved to level the city of Jerusalem with the ground, that is, those buildings which the Jews had erected, to destroy three towers that were left by Titus for the convenience of the Roman garrison, and to foul falt in the ground on which the city had flood. Thus did Adrian, whatever were his motives, literally fulfill the prediction of our Saviour, that neither in the city nor the temple should one stone be left upon another. This final destruction took place 47 years after that of Titus. The further attempts of Adrian are recited under the article of *Jerusalem*.

For an account of the honours paid to Jerusalem and its vicinity by the mother of Constantine the Great, see *Calvary*, *Invention of the Cross*, and *Helena*. For Julian's attempt to build the temple at Jerusalem, see *Julian and Temple*. The emperor Julian erected a magnificent church to the Virgin Mary at Jerusalem. For the foundation of this church a level was formed, by raising part of a deep valley to the height of the mountain. The stones of a neighbouring quarry were hewn into regular forms; each block was fixed on a peculiar carriage drawn by 40 of the strongest oxen, and the roads were widened for the passage of such enormous weights. Lebanon furnished her loftiest cedars for the timbers of the church; and the feasable discovery of a vein of red marble supplied its beautiful columns, two of which, the supporters of the exterior portico, were esteemed the largest in the world. To complete the celebrity of this church, the holy vessels of the Jewish temple, recovered by Belarius after their long peregrination, says Gibbon, were deposited in it.

In the year 614, the Persians, under the command of Chosroes, took Jerusalem by assault. The sepulchre of Christ, and the flately churches of Helena and Constantine, were confounded, or at least damaged by the flames; the devout offerings of 500 years were rifled in one sacrilegious day; the patriarch Zachariah, and the "true croses" were transported into Perfail; and the massacre of 90,000 Christians is imputed to the Jews and Arabs, who swelled the disorder of the Persian march. However, in 628, Jerusalem and the holy croses were restored to Heraclius, who banished from the city all the Jews, and prohibiting their coming within three miles of it. After the battle of Yermuk in 626, and a siege of four months, Jerusalem surrendered to the Saracens, under the command of the caliph Omar, and it remained for several centuries under the government of the caliphs, who were Mahometans, and of course the prevailing religion was Mahometan. The Turks, after having reduced Damascus by fire and sword, took posileion of Jerusalem A.D. 1076; and under the government of these masters, the condition of the Christians was very deplorable; the pilgrims, who were numerous from all parts of the world, were grievously insulted and oppressed by the Turkmans; the pathetic tale of their sufferings excited the millions of the west to march under the standard of the croses to the relief of the Holy Land. "A nerve," says Gibbon, "was touched of exquisite feeling; and the sensation vibrated to the heart of Europe." The Turks were constrained to surrender Jerusalem to the caliph of Egypt; but after a short possession he was obliged to deliver it to the Crusaders. See *Crusade*.

Jerusalem, long to famed in history for its sanctity and its opulence, is now reduced to a poor, thinly inhabited town, of at most three miles in circuit. It is called by the Turks "Cudjembaric" and "Coudersheer." The Orientals, however, never call it by any other name than "Elkods," the Holy; sometimes adding the epithet "el sherif," the noble. The ground between Rome and Jerusalem is rugged, mountainous, and barren. When its situation is confided, deftitute of water, and surrounded by dry channels of torrents and steep hills, we may well be astonished at its ancient greatness. It is seated on an eminence, but surrounded by others of greater height; and its walls, which remain tolerably perfect, and constructed of a reddish stone, form the chief object in the approach. The best view of Jerusalem is from the mound of Olives, on the east of the city. In front is the chief mosque, which, according to the tradition of the Mahometans, contains the body of Moses; from the same mount may be discovered, on a clear day, the "Dead Sea," nearly S.E., reflecting a whitish gleam; the intervening region appearing very rocky. The "Tombs of the Kings," as they are called, are worthy of notice, being of sculptured on a hard rock. There are several ornaments on the fchepholagi of filage and flovus. Each apartment is secured with a massive pannelled door of stone. These tombs, which have been frequently ravaged in search of treasure, are supposed to have been constructed in the time of Herod and his successors, kings of Judea. The inhabitants are partly Christians and partly Mahometans, and they are actuated by a spirit of discord and hatred towards one another. From the respect which they profess for the sacred places contained in this city, one would be apt to imagine that they were a very devout people; but Volney represents them as well deferring the reputation of the vilest people in Syria, not excepting even those of Damascus. He supposes their number to amount to 12,000 to 14,000; Brown states the present population of Jerusalem at from 18 to 20,000. The Christian women, who abound in Jerusalem, wear white veils, as a distincion from the Mahometans, who wear other colours. Arabic is the general language, except among the Armenians and Greeks. Jerusalem has had from time to time governors of its own, with the title of Pachas; but it is now governed by an aga, motfallam, or deputy governor, appointed by the pacha of Damascus, who is allowed to few troops, that all Palestine may be regarded as in the power of the Arabs. The motfallam, availing himself of the disposition to make pilgrimages to Jerusalem and its vicinity, which has prevailed for many ages, and which still continues, farms his government, and receives the revenues arising from the Muri, the customs, and especially from the fkill of the Christian inhabitants. In order duly to appreciate the value of this last article, it must be understood, that the different communions of Schismatic and Catholic Greeks, Armenians, Copts, Abyflilians, and Franks, mutually envying each other the possession of the holy places, are continually endeavouring to oust each other in the price they offer for them to the Turkish governors. They are constantly endeavouring to obtain some privilege for themselves, or to take it from their rivals; and each fact is perpetually informing against the other for irregularities. Hence proceed those hatreds, and that eternal jangling which prevail between the different convents, and the adherents of each communion. Every dispute yields profit to the Turks; and also perquisites for the motfallam, which annually amount to upwards of 100,000 piastres.
Every pilgrim pays him an entrance fee of ten piastres, and another for a fare on the journey to the Jordan, besides other fees as fines for misbehaviour during the stay of the pilgrims, and duties on the exportation of certain sanguine commodities from Jerusalem, such as beads, relics, sacred vases, crosses, pillows, agnus dei, scapularies, &c. of which near 300 chests are sent off annually. The fabrication of these utensils of piety procures subsistence for the greatest part of the Christian and Mahometan families of Jerusalem and its neighbourhood; men, women, and children being employed in carving and turning wood and coral, and embroidering in silk, with pearls, and gold and silver thread. The convent of the Holy Land, alone, lays out annually to the amount of 50,000 piastres in these works, and those of the Greeks, Armenians, and Copts, taken together, pay a larger sum. These commodities, exported to Turkey, Italy, Portugal, and especially to Spain, produce a return of considerable sums, either in the form of alms or payments. To this the convents join another article not less lucrative, viz., the visits of the pilgrims. It is well known that at all times the devout curiosity of visiting the "holy places" has occasioned Christians of every country to resort to Jerusalem. It was formerly taught by the ministers of religion as indispensible necessary to salvation, and this pious zeal pervading all Europe, gave rise to the cruades. (See Crusades.) Since their unfortunate issue, the zeal of Europeans has cooled, the number of pilgrims has diminished, and they are now reduced to a few Italian, Spanish, and German monks; but this is not the case with the Orientals, their priests and monks, deriving advantage from this fervour, do not cease to promote it. The Greeks, especially, declare that "the pilgrimage ensures plenary indulgence, not only for the soul, but even for the body; and that it absolves not only from murder, incest and pederasty; but even from the neglect of fasting, and the non-observance of festivals, which are far more heinous offences." Accordingly, every year a crowd of pilgrims of both sexes, and of all ages, set out from the Morea, the Archipelago, Constantinople, Anatolia, Armenia, Egypt, and Syria, the number of whom, in 1784, amounted to 2000. This zeal, however, is found to be very expensive since the most moderate pilgrimage never costs less than 160l. and some of them, by means of offerings, amount to 2500l. Yafa is the port where the pilgrims disembark; they arrive in November, and repair without delay to Jerusalem, where they remain, in inconvenient but very expensive lodgings, till after the festival of Easter. The pilgrims must also be at great charge in paying for maules, services, and exorcisms, and also in the purchase of crucifixes, beads, &c. On Palm Sunday they go to purify themselves in the Jordan, which is an expensive expedition. One year with another, it produces to the governor 15,000 Turkish sequins, or 468l. When Easter is past, each person returns to his own country, proud of being able to rival the Mahometan in the title of pilgrim, and bearing imprinted on their hands, wrists, or arms, figures of the crofs or spear, with the cypher of Jesus and Mary. The difference between these two classes of pilgrims is, that those of Mecca are called "Hadjes," and those of Jerusalem "Mokodi," a name formed from that of the city, "El-Kods." The number of pilgrims who reside at Jerusalem for five or six months, leave behind them a sum not less than 2,500l. (See Pilgrimage.) These pilgrims draw together to Jerusalem a swarm of mendicants, and yet notwithstanding the wealth accumulated and expended by this city under the influence of priestcraft and superstition, the church of the Holy Sepulchre, the glory of former times, and the monument of Helena's piety, is so much neglected, that the snow falls into the middle of it; the beams, laid to be cedar, are falling, and the whole roof is in a ruinous state. The Armenian convent is said to be elegant, and so extensive as to furnish accommodation for no less than 1000 pilgrims. When Mr. Browne visited this city in February 1797, a very deep snow lay upon the ground for 12 or 13 days. The Catholic convent has a large subterraneous cellar, into which the snow, melting from the roof and other parts, is conveyed, and supplies the monks with water for a great portion of the year. Anc. JERUSALEM, a post-town of America, in the county of Ontario, and state of New York; lying on the W. side of Seneca lake, and containing about 50 families, and 1219 inhabitants; 30 miles N.E. by N. of Bath.

JERUSALEM, or Funkstown, a town of Maryland, in Washington county, about 25 miles S.W. of Elizabeth town; containing about 50 dwellings and a German church.—Alto, a post-town in Southampton county, Virginia; 250 miles from Washington.

JERUSALEM, Old. See Fallen City.

JERUSALEM, a town of the duchy of Courland; 44 miles E.S.E. of Stockholm.—Alto, a town of the duchy of Sardinia, celebrated for its wine; four miles S.S.W. of Friaul.

JERUSALEM, New, in Theology. See Millennium.

JERUSALEM, Artichokes, in Botany. See Helianthes.

JERUSALEM, Coquilles. See Shell.

JERUSALEM, Cork. See Lychins.

JERUSALEM, Oak. See Cheno-podium.

JERUSALEM, Sage. See Pilonis.

JERUSALEM, Sage of. See Pulmonaria.

JERUYO, in Geography, a singular mountain, situated in the valley of Ureclo, in Mexico or New Spain; which before the year 1766 was a small hill, bearing a sugarcane plantation, but from September in that year it has continued to emit fire and burning rocks, that have formed themselves into three high mountains, whose circumference in 1766 was nearly six miles. At the eruption the ashes were forced to the distance of 150 miles.

JERXHEIM, a town of the principality of Wolfenbuttel; 13 miles E.S.E. of Wolfenbuttel.

JESAN, a delightful mountain of Japan, near the lake of Oitiz; which is esteemed sacred, and, according to Kämpfer, is said to present not less than 3500 temples.

JESAW, a town of Prussia, in the circle of Natangen; 10 miles S. of Königberg.

JESEN, in Ichthyology. See Lentil.

JESENITZA, in Geography, a town of Croatia; 35 miles N.W. of Bihaç.

JESERNICO, a town of Italy, in the country of Friuli; 12 miles W. of Palma la Nuova.

JESERO, a singular lake in the ile of Cherho, which only diffuses its waters every fifth year.

JESHANA, in Scripture Geography, a city of Ephraim (2 Chron. xiii. 10.), probably the same with Zin (Numb. xxxiv. 4.), placed by Eusebius and Jerome seven miles N. of Jericho.

JESHIMON, probably the same with Hosmona, Afmona, or Esmona, a city in the wilderness of Moab, belonging to Simeon, lying in the S. of Palæstine, and even in Arabia Petraea. (1 Sam. xxviii. 24.)

JESI, in Geography, a town of the marquisate of Ancona; the fee of a bishop, containing three churches and ten convents;
convents; 16 miles W.S.W. of Ancona. N. lat. 40° 31' E. long. 13° 10'.

JESILBASCH, Green-head, a name of reproach which the Perians give to the Turks, because their ears wear a green turban.

JESIORO, in Geography, a town of Poland, in the pala-

JESAMINE, in Botany. See Jasminum.

JESSAMINE, in Geography, a county of Kentucky, in America; containing 5438 inhabitants, of whom 1553 are slaves. The chief town is Nicholasville.

JESSANT, formed from the obsolete French jeffer, to rife, or spring out, in Heraldry, is applied to a fleur-de-lis, or the like figure, seeming to spring or shoot out from some other charge. He bears a fleur-de-lis, or jef-

JESSE, a large brafs candlestick, with many salmon hanging down in the middle of a church or choir. This invention was first called jeffer, from the similitude of the branches to those of the arbor jeffer. This useful ornament of churches was first brought over into this kingdom by Hugh de Flory, abbot of St. Auftin's, in Canterbury, about the year 1100.

JESSELMORE, in Geography, a town of Hindoofhan, in the circle of Bickaner; 60 miles W. of Bickaner. N. lat. 27° 28'. E. long. 72° 5'.

JESSA, a town of Saxony, on the Elber; 10 miles E.S.E. of Wittenberg. N. lat. 51° 48'. E. long. 13° 3'.

JESSÉS denote ribbons hanging down from garlands and crowns; also the short fraps of leather fastened to a hawk's legs, and fo to the vessels; and birds, in Heraldry, are said to be jeffed, when these jeffes are of a different tincture from the other parts.

JESSIMA, in Geography, one of the islands of Japan.

JESSNITZ, a town of Germany, in the principality of Anhalt, on the Muldua; nine miles S. of Delfau. N. lat. 51° 42'. E. long. 12° 20'.

JESSO, Jeddo, or Yedo, a large island in the North Pacific ocean, N. of Nippon, which having received some Japanefc colonies, is generally regarded as subject to Japan; but, being inhabited by a favage people, is rather considered as a foreign conquest than as a part of this civilized empire. The inhabitants live chiefly on fish and game. This island is divided by a narrow ftrait, about 20 miles broad, from the island of Segatana, or Teboko, which fec. N. lat. 42° to 45°. E. long. 136° 10' to 147° 10'.

JESSORE, a town of Bengal; 54 miles N.E. of Cal-

JESTING, or Canife Wit, as distinguished from continued wit or humour (which fec), lies either in the thought, or the language, or both. In the firft cafe it does not depend upon any particular words or turn of the expression. But the greatest fund of jest lies in the language, i.e. in tropes or verbal figures; those afforded by tropes conflit in the metaphorical fenfe of the words, and those of verbal figures principally turn upon a double fenfe of the fame word, or a similitude of found in different words. The third kind of jokes, which lie both in the fenfe and language, arise from figures of fentences, when the figure itself conflits in the fenfe, but the wit turns upon the choice of the words. Ward's Orat. vol. ii. Lecl. 40. See Wit.

JESUATES, JESUATE, an order of religious, otherwise called Aposfolic Clerks, or Jesuates of St. Jerome.

They were founded by John Colombini in 1368, and approved of by Urban V. in 1369, at Viterbo; where he himfelf gave, to fuch as were prefent, the habit they were to wear. They followed the rule of St. Auguftin, and were ranked by Pius V. among the order of Mendi-

JESUITS, an order of religious, founded by Ignatius Loyola, a Bifeayan military gentlemam, of a fanatfical and ambitious spirit, called also the Society of Jesus. They are also sometimes called Loyolites, and sometimes Inftifts, from the Spanifh name of their founder, which was Inffo de Guipuxcoa.

This order, which was the moft political and beft regulated of all the monaffic orders, and from which mankind have derived more advantages, and received greater hurt, than from any other of these religious fraternities, has rendered itfelf very confiderable by its missions into the Indies, and by its other employing relations to the fudy of the sciences, and the education of youth. The council of Trent calls them "Regular Clerks of the Company of Jesus." In the year 1538, Ignatius, having assembled ten of his companions at Rome, chosen mostly out of the university of Paris, proposed to them to make a new order. After this, he prefented the plan of his iftitution, fuggesfed, as he gave out, and his followers fill teach, by the immediate infpiration of heaven, to the Roman pontiff, Paul III. who appointed a committee of cardinals to examine it; upon whole report, that the ftablifhment was unneccary as well as dangerous, Paul refused to approve it. This oppofition was principally urged by the learned and worthy cardinal Giuscicci.

This oppofition was vanquifhcd by the dexterity of Ignatius, who prefented, that besides the three vows of poverty, chriftianity, and monaffic obedience, the members of this fociety should take a fourth vow of obedience to the pope; binding themselves to go whitherfoever he fhouid command, for the service of religion, and without requiring any thing from the holy fce for their support. However, Ignatius, and his company in the fame charter of their order in which they declare their implicit and blind allegiance to the court of Rome, promise a like implicit and unlimited allegiance to the general of their fociety. The pontiff, perceiving this iftitution to be an object of confequence, confirmed it under the name of the "Company of Jesus" by a bull in 1540; and appointcd Ignatius Loyola to be the firft general of the order. Loyola was originally an illiterate ffolder, and is prefupped by many to have been only a flexible instrument in the hands of able and ingenious men, who made use of his fubordination and fanatifm to answer their purposes, and perfons much more learned were employed to compofe the writings which bear his name. Geddes's Traets, vol. iii. p. 429.

By this bull the number was restrained to sixty; but that restriclion
restriction was taken away two years afterwards by another bull. The order has since been confirmed by several succeeding popes, who have added many new rights and privileges to it.

In less than half a century after its institution, the society obtained establishments in every country that adhered to the Roman Catholic church; in the year 1608, the number of Jesuits had increased to 10,581. In the year 1710, the order possessed 24 professed houses; 59 houses of probation; 340 refectories; 612 colleges; 200 millions; 150 seminaries and boarding-schools; and confided of 19,995 Jesuits.

The constitution and laws of the society were perfected by Laynez and Aquaviva, the two generals who succeeded Loyola, men far superior to their matter in abilities, and in the science of government. Several circumstances conduced to the rapid progress and extensive influence of the Jesuits. They were taught to consider themselves as formed for action, and bound to exert themselves continually, as soldiers in the service of God, and of the pope, his vicar on earth. And that they might have full leisure for their active service, they were totally exempted from those functions, the performance of which is the chief business of other monks. They were required to attend to all the transactions of the world; to study the dispositions of persons in high rank, and to cultivate their friendship; and by the constitution as well as genius of the order, a spirit of action and intrigue was infused into all its members. Besides, the form of government of this order was peculiar: Loyola, full of the ideas of implicit obedience, which he had derived from his military profession, appointed that the government of this order should be purely monarchical. A general, chosen for life by deputies from the several provinces, possessed power that was supreme and independent, extending to every person and to every cause. He, by his sole authority, nominated provincials, rectors, and every other officer employed in the government of the society, and could remove them at pleasure. In him was vested the sovereign administration of the revenues and funds of the order. Every member belonging to it was at his disposal; and by his uncontrollable mandate, he could impede upon them any task, or employ them in whatsoever service he pleased. To his commands they were required to yield not only outward obedience, but to reign to him the inclinations of their own wills, and the sentiments of their own understandings.

There is not in the annals of mankind any example of such a perfect despotism, exercised not over monks shut up in the cells of a convent, but over men dispersed among all the nations of the earth. It is carefully provided, that the general should be perfectly informed with respect to the character and abilities of his subjects. Every novice, who offered himself a candidate for entering into the order, was obliged to manifest his confidence to the superior, or to a person appointed by him every six months: each member was likewise enjoined to observe the words and actions of the novices, and to disclose every thing of importance to the superior. The provincials and heads of the several houses were also obliged to transmit to the general, regular, frequent, and minute reports concerning the members under their inspection. These reports were digested and arranged in registers, by which the general might easily survey the state of the society in every corner of the earth; observe the qualifications of its members, and choose proper instruments for any necessary service. The number of these reports received annually by the general was 6584, which divided by 377, the number of provinces in the order, gives 177 reports concerning the state of each province transmitted annually to Rome. The general also received, by the constitution of the order, an account of the civil affairs of the country where his subjects resided; so that he was furnished with full information concerning the transactions of every prince and state in the world. The Jesuits, from their first institution, considered the education of youth as their peculiar province; and before the expiration of the 16th century, they had obtained the chief direction of this business in every Catholic country in Europe. They had also become the confessors of almost all its monarchs; they were the spiritual guides of almost every person eminent for rank or power; and they possessed the highest degree of confidence and interet with the Papal court, as the most zealous and able champions for its authority. The order, notwithstanding the vow of poverty which they contrived to elude, acquired ample possessions in every Catholic country. Besides the sources of wealth common to all the regular clergy, they obtained, under a pretext of promoting the success of their missions, and of facilitating the support of their missionaries, a special licence from the court of Rome to trade with the nations which they laboured to convert. In consequence of this, they engaged in an extensive and lucrative commerce, both in the East and West Indies: they also aimed at obtaining settlements, and accordingly acquired possession of a large and fertile province in the southern continent of America, and reigned as sovereigns over some hundred thousand subjects.

The progress and influence of the Jesuits were likewise much promoted by their mutual union for the good of the common cause; by their reputation for learning and science, in which they excelled all the other orders, though M. d'Alembert says, that the order has never produced one man, whose mind was so much enlightened with sound knowledge as to merit the name of a philosopher; by the severity of their discipline and regularity of their conduct and manners; by propagating a system of relaxed and plural morality, which accommodated itself to the passions of men, justified their vices, tolerated their imperfections, and authorized almost every action, which the most audacious or crafty politician would wish to perpetrate. So that the abbe Boileau says of them, they are a people who lengthen the creed and shorten the decalogue; by extending the jurisdiction and absolute power of the court of Rome; and by the zeal which they have manifested in combating the opinions and checking the progress of the Protestants.

The end principally propounded by this order was to gain converts to the Romish church; with which view they differed themselves in every country and nation, and with amazing industry and address pursued the end of their institution. Their number increased from year to year, and in 1542, it was 20,000; there were 30,000 in 1552; and it has been estimated, that in the year 1610, there were upwards of 100,000 Jesuits, in every part of the world. A Jesuit was stationed in every principal city of Europe; and in every country of the East Indies. They had Jesuitical colleges in every part of Africa, and in the West and East Indies. They were in every part of the world, and were the principal missionaries of the Church of Rome.

The Jesuits were employed in every part of the world, to propagate the Gospel, and to quench the fire of heresy. They were employed in every part of the world, to propagate the Gospel, and to quench the fire of heresy. They were employed in every part of the world, to propagate the Gospel, and to quench the fire of heresy. Ricci, an Italian, penetrated into China, and established churches, some remains of which subsist to this day. Robert de Nobili is much celebrated by the Jesuits on account of his success in profaning the Brahmans: for the method he used, see BRACHMANS. The Jesuits are charged by the Jansenists and Dominicans with many fraudulent practices in their attempts to propagate Christianity in China; and particularly with endeavouring to pervert the Chinese, that the doctrine of Confucius and that of the gospel were not essentially different, and that Jesus Christ had been known and worshipped in their nation many years ago. Ricci allowed the Chinese converts to retain the profane customs and the absurd rites of their Pagan ancestors; but his opinion was condemned by the Dominicans and Franciscans. This difference laid the foundation of a long and violent contest. Innocent X. in 1645, pronounced sentence in favour of the Dominicans; but, about eleven years after, Alexander VII. granted the Chinese the indulgence proposed by Ricci. Complaints were renewed by the Dominicans in 1661, and again in 1674, under the pontificate of Innocent XI.; and the dispute was carried on both in Europe and China, from the year 1684, till the question was decided to the disadvantage of the Jesuits in the year 1724, by Clement XI.; but this edict was mitigated in 1715. It is well known that the inquisition erected by the Jesuits at Goa, where the body of Xavier lies interred, and is worshipped with the highest marks of devotion, and the penal laws, whose terrors they employed so freely in propagation of the gospel, contributed much more than their arguments and exhortation, which were but sparingly used, to engage the Indians to embrace Christianity.

About the beginning of the 17th century, the Jesuits obtained admission into the fertile province of Paraguay, in South America, where they found the inhabitants in a barbarous and savage state; they began with instructing and civilizing them; cultivating amongst them the arts and manufactures, and accustoming them to the blessings of society, security, and order. By this method they secured their esteem and confidence; and a few Jesuits prefided over some hundred thousand Indians. However, it appears from the most credible relations, that they soon changed their views from the propagating of Christianity, to schemes of inestimable avarice and boundless ambition; and they have from yeart to the members of their order, in Europe, immense quantities of gold, drawn from several American provinces where they have power and property, but chiefly from Paraguay, which belonged to them only; and it is evident, from later discoveries, which have proved the ruin of the Jesuits in Spain and Portugal, that they had established an independent empire in this province, subject to their society alone, and which, by the superior excellence of its constitution and police, could scarcely have failed to extend its dominions over all the Southern continent of America. They cut off every kind of communication between the Spaniards and Portuguese in the adjacent settlements, and the Indians; inspired the latter with hatred and contempt of the former nations; inductively avoided giving the Indians any knowledge of the Spanish, or other European language; instructed them in the art of war; formed them into bodies of cavalry and infantry, and provided them with artillery and magazines fired with all the implements of war. Such was the state of things when, in the year 1570, the court of Madrid and Lisbon entered into a treaty for fixing the limits of their respective dominions in South America. In the execution of the treaty, in the year 1572, the Jesuits demurred; and a war ensued between the Spanish and Portuguese on one side, and the Indians, animated by the Jesuits, on the other; which was the real and original cause of the disgrace of the Jesuits at the court of Portugal.

The Jesuits have been justly charged with inculcating the most licentious and dangerous maxims with regard to morality and religion: such are the following extracted from their writings. That persons truly wicked and void of the love of God, may expect to obtain eternal life in heaven, provided that they be impressed with a fear of the divine anger, and avoid all heinous and enormous crimes through the dread of future punishment: that these persons may transgress with safety, who have a probable reason for transgressing; i.e. any plausible argument or authority in favour of the sin they intended to commit: that actions intrinsically evil, and directly contrary to the divine laws, may be innocently performed, by those who have to much power over their own minds, as to join, even ideally, a good end to this wicked action, or to speak in their style, who are capable of directing their intention right: that philosophical sin is of a very light and trivial nature, and does not deserve the pain of hell: by philosophical sin they mean an action contrary to right reason, which is done by a person who is either absolutely ignorant of God, or does not think of him during the time this action is committed: that the transgression committed by a person blinded by the seduction of lust, agitated by the impulse of tumultuous passions, and defiled of all sense and impression of religion, however detestable and heinous they may be in themselves, are not imputable to the transgressor before the tribunal of God; and that such transgressions may often be as involuntary as the actions of a madman: and that the person who takes an oath, or enters into a contract, may, to elude the force of the one, and the obligation of the other, add to the form of words that express them, certain mental additions and tacit reservations. Some of these maxims were condemned by a public edict of pope Alexander VII. in 1659; and that relating to philosophical sin met with the same fate in 1660, under the pontificate of Alexander VIII. Neither of these bulls are to be found in the "Bullarium Pontificum"; but they are indubitably preferred by the Jansenists and Dominicans. The corrupt morality of the Jesuits was humourously and learnedly attacked by the famous Pascal, in his work, entitled "Les Provinciales, ou Lettres écrites par Louis de Montalte, à un Provincial de ses Amis et aux Jésuits, pour la Morale et la doctrine de ces Pères." The Jansenists, however, obtained a sentence against the Provinciales, by which they were condemned to be burnt publicly at Paris. Another excellent book, by Pernaut, published at Mon, in 3 volumes 8vo., in the year 1702, entitled "La Morale des Jésuites, extrait fidèlement de leurs Livres, imprimés avec la Permission et l'Approbation des Superieurs de leur Compagnie, par un Docteur de Sorbonne," was burnt at Paris, in the year 1679, at the request of the Jesuits. The famous Arnauld, with some of his Jansenist brethren, have undertaken to prove, that the Jesuits reduced their pernicious maxims to practice, in a celebrated work, entitled "La Morale Pratique des Jésuites," consisting of eight volumes 8vo., the second edition of which was published at Amsterdam in the year 1742. For an acount of the controversy between the Jesuits and Jansenists, see Jansenists.

The Jesuits had no particular habit; but changed and accommodated it to times and occasions. The order consisted of five different classes: professed fathers, spiritual coadjutors, approved scholars, lay brothers, called also temporal coadjutors, and novices. Some writers make only three classes, viz. the professed members, the scholars, and the novices. Some add
add a sixth class, under the title of *adjuncts*, which they say
was numerous, and was incorporated with the other classes,
and distinguished under different forms of apparel.

The *professed fathers*, which made the body of the company,
took the three solemn vows of religion publicly, and to these
add a special vow of obedience to the head of the church, as
to what regards missions among idolaters, heretics, &c. — The
*spiritual conlocutors* also made public vows of chastity, poverty,
and obedience, but omitted the fourth relating to missions.

—Approved scholars* were those who, after two years novi-
ciate, had been admitted, and had made three vows of reli-
gion; not solemn, indeed, but yet declared. They were
in the way to become professed, or spiritual conlocutors, ac-
cording as the general thought fit. These degrees, espe-
cially that of professed, were never conferred till after two
years noviciate, and seven years study, seven of regency, a
third year of noviciate, and thirty-three years of age; the
age at which our Saviour is supposed to have been
acrucified. The vows of the scholars were absolute on their
side, but only conditional on the side of the order; the gen-
eral having it in his power to dispence with them.

The order was divided into *affiances*, the affinities into
*provinces*, and the provinces into *houses*. It was governed
by a general, who was perpetual and absolute. He refided
at Rome, and was elected by a general congregation of the
order. He had with him five persons, who were, as it
were, his ministers. They were called *affiants*, and bore
the name of the kingdom or country to which they be-
longed, and by which they were appointed; viz. of Italy,
France, Spain, Germany, and Portugal. To these belonged
the care of preparing the matters of their respective affin-
ances, and of putting them in a method to facilitate their
dispatch.

Each province had four kinds of houses, viz. *professed
houset*, which could have no lands belonging to them;
*colleges*, where the sciences were taught; *refidues*, where
were a number of workmen employed in such offices, as
had any immediate relation to preaching, confession, missions,
&c.; and *houset of novices*. Among the colleges there
were some called *simpely colleget*, and others called *seminaries,*
These last were set apart for the young Jesuits to go through
their courses of philosophy and theology in; the others
were for strangers.

Each province was governed by a *provincial*, and each
house by a *superior*; who was called *rector* in the colleges,
and a *superior* in the other houses. Ignatius regulated the
discipline of these houses, and especially of the colleges, by
what he had observed in the Sorbonne, while he studied at
Paris.

The professed of this order renounced by a solemn vow all
preference, and especially prelacy; and could not receive
any, unless enjoined thereto by the pope, under pain of sin.
This the pope sometimes did; infomuch that they have had
eight cardinals of their order.

The reader will find, in the preceding part of this article,
a brief but comprehensive account of the Jesuits, as to their
origin and influence, and the chief causses on which their
influence depended, and the nature of their constituition:
it remains to direct his views to their decline and actual
suppreffion, in some parts of Europe, where their credit,
power, and opulence had at one time arrived to a prodigious
height. In France, the affiliation of Henry IV. by Jean
Chatel, one of their scholars, and the writings of the Jesuit
Guiguard, in favour of regicide, induced several of the
parliaments of the provinces to expel them, as a detestable
and diabolical society, the corruptors of youth, and enemies
to the king and state. But they were again favoured by
Louis XIII. and cardinal Richelieu, and also by Louis
XIV.; in whose reign they obtained the revocation of the
edict of Nantes against the Protestants, and succeeded almost
to their utmost wishes in suppressing the Jansenists, their
invertebrate enemies. However, at this period, their affairs
seem to have taken a different turn. Father Teller's viol-
ence in destroying the famous Port-Royal, and the uni-
versal commotion occasioned by the bull Unigenitus, raised cla-
mours against them, which never subsided till their ruin.
The refual of the sacrament to the Jansenists served also to
light up the flame which succeeded, and before it could be
extinguished, effected the dissolution of the Jesuits. About
this time they also refuced, as it is said out of respect to
the queen and dauphin, to undertake the spiritual guidance
of La Pompadour: and whilst they offended the court by
their scruples, they displeased it equally by their intrigues;
laying snares for disgracing persons in place, whose only
crime was a disregarde for their society. They also of-
offered men or letters by their violent declarations
against the Encyclopædie, and by their abuse of Voltaire,
the author of the Henriade. In this situation of the
Jesuits, the war broke out between England and France,
which involved the society in that famous law-fuit, which
directly brought on its destruction. Having carried on a
considerable commerce in the island of Martinico, and
funded some losses by the war, they wanted to compound
their debts with their correspondents in Lyons and Mar-
foilles. These correspondents, looking upon the society in
general to be answerable for their brethren in Martinico,
addressed themselves to a certain Jesuit in France, demanding
justice. This good father, and the Jesuits in general, de-
murred, and tried trial before the grand-chamber of the
parliament of Paris, where they were called; and not only
sentenced to pay the immense sums in litigation, but in-
dicted for the future all manner of commerce. This fen-
tence led into an examination of their constitution by their
own books; which appeared to be contrary to the laws of
the kingdom, the obedience due to the king, the safety of
his person, and the peace of the state. Besides, the Jesuits
were grown rich, insolent, and imperious; and though
they professed to have renounced the world, they were found
to be tutors, courtiers, merchants, politicians, priests,
and wanted nothing left than to be governors and rulers of the
date. These were sufficient motives for suppreffing them:
the attempt to affallinate the French king in 1757 was
charged on the Jesuits: and the actual affallination of the
king of Portugal in the following year, which induced the
Portuguese minister to drive them all out of the kingdom, in
1759 increafed the odium against them. The parliament of
Paris having taken a whole year to enquire into the nature of
their institution, and news of the capture of Martinico
in the mean while arriving, the minister, as M. d'Alem-
bert says, in order to caufe a diversion, thought on the
expedient of proceeding farther against the Jesuits; and the
principal of their college was commanded to obey the
arrests of parliament, and to shut up their schools on the
first of April, 1762. On the sixt of August following,
their institution was unanimously condemnded by the
parliament, without any opposition on the part of the so-
vereign; the society was of course dissolved; and their
possessions alienated and sold; the other parlements of the
kingdom following sooner or later the example of that of
Paris: nay some of them acted with still greater severity,
tracing them out of their provinces without standing upon
forms of law. In general, however, individuals were per-
mitted
mitted to reside in France, on renouncing the society, and taking oaths of allegiance to the king. In a little while after, the king issued an edict, which abolished the society throughout all France. The parliament of Paris, on regis-
ttering this new edict, ordained the Jesuits to reside each in his own diocese, and to present themselves every six months before the magistrates of the place in which they shall dwell. The same arrest forbade them to come within ten leagues of Paris, and banished them at least six leagues from Verfalières, but prohibited them not from dwelling at Fontainebleau and Compiegne, where the court resided. At least three months in the year. The Jesuits were expelled from Portugal in 1759; from France in 1764; from Spain and Naples in 1767; and their society was totally abolished, in 1773, by pope Clement XIV. JESUS, formed of the Hebrew יֵאָוָאש, Jehoasab, from יָאָש, and denoting “he that shall save,” or “the Saviour,” is an appellation appropriated by extraordinary direction, and in a very peculiar and distinguishing manner, to the Son of God and the Saviour of the world; the long predicted and expected Messiah. (Luke i. 26—38.) This name is frequently used in connection with that of “Christ,” for the origin and meaning of which see that article. For the different senses in which the appellations Son of God and Son of Man have been understood, see those articles respectively. No one who adverts, even in the slightest manner, to the history of our blest Lord given by the four Evangelists, and to the writings of those who were supernaturally instructed to teach his doctrine, can hesitate for a moment in allowing the propriety of ascribing to him the name of “Jesus” in a super-eminent degree: for though this was a name of Hebrew etymology, and was given, under one form or other, to several distinguished persons among the Jews, it never could be more fitly applied than to him, who, acting under a divine commission, favored mankind from fin and death, and conducted them to knowledge, pardon, holiness, and immortality. See Christian Religion.

Of the life of Jesus Christ we have an authentic account by the four evangelists, Matthew, Mark, Luke, and John. (See each article respectively, and also Evangelists.) The account of those historians chiefly relates to his discourses and conduct after he commenced the exercise of his public ministry. After giving us brief information concerning his birth, lineage, family, and parents, they tell us that he was born at Bethlehem; and that in order to avoid the jealousy and cruelty of Herod, he was taken by his parents into Egypt. Upon the death of Herod he returned to Judea; but excepting one specimen that is recorded of his early wisdom, when he disputed with the Jewish doctors in the temple at the age of 12 years, we know little of his history till he attained the age of about 30 years. Whether he was employed in his father’s business, during his earlier years, as some have affirmed, it is not possible certainly to determine. We know, however, that he increased in wisdom as well as stature, and in favour with God and man. Before he commenced his public ministry, his advent was announced by John the Baptist, and he was baptized by him in the river Jordan. In the course of his subsequent life, which was of so long duration, he maintained a character singularly irreproachable, and in the most perfect degree exemplary. He was active and unceasing in communicating instruction, and in performing miracles, which, in their nature, mode of operation, and general objects, exhibited the unparalleled benevolence of his disposition, and which served to evince, to every unprejudiced observer, his divine origin and mission. In his character and conduct, as well as in his humble and suffering state, he manifested to the world that he was the predicted and long expected Messiah; and the predictions which he himself delivered, served, in their ultimate issue and accomplishment, to manifest the same important and useful purpose. For his affinities in the differentiation of his super-excellence doctrine, and by way of preparing suitable successors, when his life terminated, he appointed apostles and evangelists, who were supernaturally endowed and qualified for the service which was assigned them. After a limited period of service and suffering, a conspiracy was formed against him by the leaders of the Jewish nation; which, after the purposes of his mission, during his life, were fulfilled, took effect by the treachery of Judas Iscariot. At length he was brought before the Sanhedrim; and though Pilate, the Roman governor, testified to his innocence, and wished to preserve his life, the clamour of the populace prevailed. Jesus was condemned to suffer an ignominious death, and the sentence was speedily executed. By his death he accomplished the purposes of the divine wisdom and goodness, as he had previously fulfilled them in the course of his life; and on the third day from the dead, agreeably to his prediction, and appeared at three o'clock, and in various places to his disciples. (See Resurrection.) Having spent the interval of 40 days in affording satisfactory evidence of his resurrection to life to competent witnesses, and in instructing his apostles concerning the nature of his kingdom and the objects of their commission, he visibly ascended to heaven, and, as a further evidence of his continued existence, and of the powers with which he was invested, conferred extraordinary gifts on his apostles, deputing and qualifying them for propagating his religion in the world. See Christian Religion.

Concerning the person of Jesus Christ, the rank of being he sustained, and the manner of his introduction to the world, divines, both ancient and modern, have entertained very different opinions. With regard to the person of Jesus Christ (see Person), some have supposed that he is the same in fulness, and equal in power and glory, with the Father. The second article of the church of England expresses this doctrine in the following words: “The Son, which is the Word of the Father, begotten from everlasting of the Father, the very and eternal God, of one fulness with the Father, took of man’s nature in the womb of the Virgin, of her fulness; so that two whole and perfect natures, that is, the godhead and manhood, were joined together in one person, never to be divided; whereof is one Christ, very God and very man, who truly suffered, was dead and buried.” Others, who cannot adopt this generally received opinion concerning Christ, as God, of the same fulness, and equal with the Father, reject the common meaning of the word ἡγεσία, and admit only what
they call a modal distinction. But in order to avoid the charge of Sabellianism, which they conceive to be a very pernicious opinion, and which holds one person only in the Deity, under three different denominations, they say, that though the Father, the Son, and the Holy Ghost are not three distinct beings, or individuals, there is a distinction, which may be represented by that of three persons. (See Sabellians.) Others again, dreading the tritheism charged upon the common opinion, suppose the Son to be inferior to the Father in every respect but this, that they are co-

ceternal, and have all the divine attributes that are communicable, not of themselves, but of the Father. Epiphanes and Cudworth adopted this opinion, and were followed by Dr. Clarke, Jackson, &c. Dr. Clarke, in particular, maintained, that there is one Supreme Being, who is the Father, and two subordinate, derived and dependent beings; but he waves calling Christ a creature, as the ancient Arians did, and principally on that foundation disclaims the charge of Arianism. (See Semi-Arians.) Bishops Pearson and Bull, and also Dr. Owen, were of opinion, that though God the Father is the fountain of the Deity, the whole divine nature is communicated from the Father to the Son; yet so as that the Father and Son are not separate, nor separable from the divinity, but do still exist in it, and are most intimately united to it. Dr. Watts, who has been followed by others, in what some have denominated the "indwelling scheme" and which, as it is sometimes interpreted, has merely shades of difference from Sabellianism, maintained, that one supreme God dwells in the human nature of Christ, which he sup-
poses to have excited the first of all creatures; and he speaks of the divine Logos (which fec) as the wisdom of God, and the Holy Spirit (see Spirit) as the divine power, or the influence and effect of it; which, he says, is a scriptural per-

son, i.e. spoken of figuratively in scripture under personal characters. Others, clasped, however they differ from one another, under the general denomination of Arians, suppose the Son to be a spiritual being or intelligent agent, subordinate and inferior to the Father; not the same with the Father, or equal to him, or of the same nature and essence; but said to be God, on account of his great excellence and power, derived to him by the will of the Father. But of those who adopt this general opinion there are various gra-
dations, as we have already shewn under the article Arians. Others, who are supposed to adopt sentiments similar to those of the ancient Nazarenes and Ebionites, and who in later times have been denominated Socinians and Unitarians, though they have no exclusive title to the latter appellation, maintain, that Jesus is a man, possessing a reasonable soul united to a human body, and favoured by God with extra-

ordinary communications of knowledge and power. Some of this class believe that Jesus was a man, not made as Adam, but born of a woman, not in the ordinary way of generation, but of a virgin, by the immediate operation and miraculous power of God (Luke, i. 35); but others, rejecting the sen-
timent of a miraculous conception, are of opinion that Jesus Christ was literally and truly the son of Joseph and Mary, born like other men in the ordinary course of nature, and subject to similar infirmities. This man, they say, was endowed with extraordinary gifts and powers for fulfilling the important commission with which he was entrusted; and when the purposes of his election and appointment were completed, he died, and was raised from the dead, in testimony to the truth of the important doctrine taught by him, and as a pattern of that resurrection of which he assured his faithful followers. Whether this opinion, or that of those who main-
tain the pre-existing dignity of the spirit of Jesus Christ, and its union with a corporeal frame by an extraordinary inter-

position of divine power, be most agreeable to the high notions we are led to entertain of the immoveable and emphatic character and supereminent office fulfilled by Christ, as the teacher, Saviour, and judge of mankind, and also to the language of the Old and New Testament by which he is dis-
scribed, we leave to the unprejudiced consideration and impartial decision of the reader. Perils of both these descriptions equally maintain the unity of God, and of the object of worship; and are therefore unquestionably entitled to the appellation of Unitarians. Moreover, it is his duty to deliberate, and to inquire without prejudice, equally disregarding the charge of credulity and innovation, whether he ought not to retain, or even now to adopt, the commonly received notion concerning the person of Jesus Christ, sanctioned as it is by the authority of many learned divines, who, after diligent examination, conceive it to be most conformable to the language of scripture, and to the doctrine of divine revelation. See Trinity and Unitarians.

Under the article Epocha of Christ, we have stated the opinions that have been generally adopted with regard to the era of our Saviour's nativity and the time of his death. But as different sentiments have been maintained respecting the duration of his ministry, we shall here inquire into the reasons on which they are founded. To this purpose, St. Luke says (ch. iii. 1, 2.) "Now in the 15th year of the reign of Tiberius Caesar, Pontius Pilate being governor of Judea,—the word of God came unto John, the son of Zacharias:—' And the angel, &c."

"Jehu also being baptized. —And Jesus himself began to be about 30 years of age." It is added in St. John's gospel, as another note of time to our present purpose, (ch. ii. 20.) "Forty and six years was this temple in building." From several circumstances stated by Dr. Lardner, it appears that Jesus was born about a year and six or seven months before the death of Herod, that is, before the latter end of the year of Rome 748 or 749, that is, in September or October. We have shewn under the article Epocha with what propriety our Lord might be said to be "about 30 years of age," in the fifteen year of Tiberius, supposing it to be the fiftteenth of his proconsular empire. Accord-

ingly, if the fiftteenth of Tiberius's proconsular empire began the 28th of August, A.D. 778, A.D. 25, and if John the Baptist began to preach in November that year, but did not baptize Jesus till after he had preached a year and some months, then the pasover at which these words were spoken was the pasover A.D. 780. A.D. 27. Or, if the fiftteenth year of Tiberius's reign began A.D. 779. A.D. 26, and John began then to preach, and Jesus was baptized by him, some time before the pasover next following, till these words would be spoken by the Jews at the pasover A.D. 780. A.D. 27. The eighteenth year of Herod's reign, from the death of Antigonus, is supposed to have begun some time in A.D. 734. Herod might make his offer to the Jews of rebuilding the temple at the feast of tabernacles in November that year; from November A.D. 734. to the pasover A.D. 780. A.D. 27, is almost 45 years; at this time, therefore, the Jews might not inappropriate say, the temple had been 40 years in building. The 46th year was then current, and it was to the purpose of the Jews rather to add to than to diminish the time which had been spent in that work; so that there is no time more suitable to these words of the Jews than the pasover A.D. 27; though there is no manner of inconvenience between un-
derstanding the fiftteenth of Tiberius, of his proconsular empire, and supposing that these words were spoken at the pasover
J E S U S.

pauffer A. D. 28, and then the temple might have been 36 years in building. The words of St. Luke, "and Jesus himself began to be about 30 years of age," may be understood with some latitude. Jesus might be 32 years of age or more at this time; the word about, 

Acts, ii. 31. Luke, i. 56. xxii. 41. John, i. 29. Acts, v. 36. Underlying St. Luke's words in this manner, it would be easy to shew the agreement of his numbers with the time of our Saviour's nativity. The fifteenth of Tiberius's sole empire began A.U. 781. A. D. 28. If Jesus was baptized the sixth of January A.U. 782. A. D. 29, he would be but some months above 33 years of age, though he was born so soon as September A.U. 738. And if he was born A. D. 749, then, though his baptism be placed in the beginning of A.U. 781. A. D. 35, still he would be little more than 33 years of age. All the other notes of time are also very easily reconciled with this fifteenth year of Tiberius's sole empire. Pontius Pilate came into Judea before the pauffers in the twelfth year of Tiberius's sole empire, A.U. 779. A. D. 26, and continued there ten years; therefore he was undoubtedly governor of Judea at the commencement of John the Baptist's ministry, and till after our Saviour's crucifixion. As for the words of the Jews, spoken by them at the first pauffer of our Saviour's ministry, "Forty-fix years has this temple been in building!" it is but to suppose that they referred not to the time when Herod made the proposal of repairing the temple, in the eighteenth year of his reign, but to the time when, in pursuance of that proposal, he actually set about the work, after he had got all things in readiness for it, and it will be easily perceived that these words are agreeable to truth. Dr. Lardner suggests, that the supposition of St. Luke's intending the first of the epochs above-mentioned, that is, the fifteenth of Tiberius's proconsular empire, seems to be very much favoured by the first Christians; who generally place the crucifixion of Jesus at the pauffer of the fifteenth of Tiberius's sole empire, when the two Gemini were consuls of Rome, A.D. 29. With regard to the duration of our Lord's ministry, it appears from the above statement to be between two and three years. Thus also, according to the Harmony of Tatian, A.D. 220, it consists of two years and a part, for the third year, in which our Lord dies, is not complete. Tatian therefore computes three pauffers in the gospels, at the last of which Jesus suffered. And it is evident that he reckoned no more, because he does not suppose the "feast" of the Jews, mentioned John, v. 1. to have been a pauffer, but pentecost, as he plainly calls it. This, says Dr. Lardner, is a mark of antiquity; modern harmonists, who prolong our Lord's ministry beyond the space of three years, generally reckon this feast, though without any good reason, a pauffer. So Irenæus computed three pauffers in our Lord's ministry; and Origen too says, that Judas was not three years with Jesus. Indeed it appears, that this father thought our Saviour's whole ministry was above two, but not quite three years, while the most public part of it did not consist of more than a year and some months; and this, says Dr. Lardner, "I have long taken to be the truth, so far as I am capable of learning it from a careful reading of the gospels." In St. John's gospel are three pauffers, and our Saviour's ministry has two years and a part; but the former part of his ministry there related, was not so public as that after John's imprisonment. In the other three evangelists, who relate chiefly our Lord's most public preaching after John the Baptist's imprisonment, is the history of only somewhat more than the space of one year; how much more it is not very easy to say; all which is much confirmed by comparing them with St. John. Eusebius discovered four successive pauffers in the gospel of St. John, and therefore was of opinion that our Saviour finished three years in his life; and his opinion has been generally prevalent. Some critics, indeed, have extended the public ministry of Christ a year or two farther, and Sir Isaac Newton makes it to comprehend five pauffers: whereas the oldest Christian fathers were almost universally of opinion, that our Lord preached no longer than one year, or one year and a few months. Mr. Mann some years ago proposed the hypothesis of one year, to which he seems to have been led by his particular interpretation of Daniel's 70 weeks, with which he makes it to correspond. The birth of Christ he assigns to the seventh year before the commencement of the common Christian era, A.U. 747. Jul. Per. 4707, and he places his death in the year 256, or the fifteenth of Tiberius, reckoned from the time of his becoming advocate in the empire with Augustus. Mr. Mann lays great stress upon the view of the ancients, cited by Sir Isaac Newton in his "Observations upon Daniel," viz. Clemens Alexandrinus, Origen, Tertullian, Julius Africanus, Lactantius, Jerome, Aulín, Syriacus Severus, and Prosper, to whom he adds Justin Martyr, and Origen. Besides, he observes that Luke mentions only two epochs in his history of Christ, that of his birth and that of his baptism; and therefore he was, with reason, understood by the fathers to comprehend in the second epoch his death with his baptism, both happening within the compas of the same year, or but a few months more. To this, says he, may be added the probability that the evangelist mentions both Annas and Caiphas as high priests, because Annas was in that office in that year which included most of the preaching and miracles of Christ. And Caiphas in the other, in the first quarter of which one Lord suffered. Moreover, the passage in Isaiah, xxvi. 1, which our Lord read in the synagogue at Nazareth, and which he notified to be then fulfilled, viz. "The Spirit of the Lord is upon me, for he has anointed me to preach the acceptable year of the Lord," was anciently, says Mr. Mann, thought to signify that Christ was to preach but one year, distinguished by that appellation. Besides, Matthew, Mark, and Luke evidently suppos'd the preaching of only one year; and even John's gospel, which alone has been thought to suppose more, will not, in fact, be found to do so. For he mentions only one summer and one winter. He describes the events of only two pauffers, one pentecost, one feast of tabernacles, and one feast of dedication; and he mentions them in their natural order, if we suppose that the sixth chapter of this evangelist hath been transposed out of its proper place, and that it should precede the fifth. Against Mr. Mann's hypothesis, it has been objected that in John, vi. 4, we read, "And the pauffer, a feast of the Jews, was nigh." But he answers, that John could not have written thus; because he had mentioned the pauffer in ch. ii. and related several of the events of it; he could not, therefore, suppose that his readers would want an explanation of the term in that place. Gerard Volfius, and other critics, would therefore read, "And a feast of the Jews was nigh," and they imagine, that the word "pauffer" was first added as a conjectural explanation of some person or other. However, it is again alleged, that the ancient fathers could never have imagined, as they did, that Christ preached only one year, if this third pauffer had been so expressly mentioned in their copies of this gospel. Besides,
there is no mention of Christ’s affixing at any third passover. Mr. Mau’s hypothesis has been adopted by Dr. Priestley, who has endeavoured, by an examination of Mr. Mau’s reasoning, and by new arguments, to confirm it. He alleges, that some very short periods of our Lord’s public ministry appear, according to the accounts of all the Evangelists, to have been very full of busines; and if he, says, our Lord had passed three or four years in this manner, and the twelve apostles had also been teaching and working miracles in six different places, for the space of a year or more, in that small country, and the 70 also in 35 places more, for the same space of time as is generally supposed; such a number of miracles would have been performed, as this author cannot but think must have exceeded every proper purpose of them. Either there could have been no unbelievers left in Judea; or, if the tendency of the miracles had been to exalt, rather than to obviate, such a remonstrance would have been excited in the minds of the Jewish rulers, as, without a greater miracle than any of the rest, could not but have terminated in his death long before. Besides, it is more easy to account for the prejudices of the apostles, and their ignorance of the true nature of Christ’s kingdom, even at and after our Lord’s death, and the supposition that his ministry was of a short, than that it was of a long duration. Further, if our Lord really preached three or four years, and, consequently, if the Evangelists have sometimes passed over all the events of whole years at a time, it is not surprising that none of them should ever connect those very distant parts of their narrative by such phrases as the year following, after two, or after two years, &c. &c. their usual transition, after these things, or afterwards, cannot be continued to mean after a year or two. Again, if Jesus had been preaching and working miracles, both in Judea and in Galilee, almost a year before the death of John the Baptist, agreeably to the common hypothesis, Herod, who reigned in Galilee, could not but have heard of him, and therefore could not but have known that he was not John that was rife from the dead, as in Matt. xiv. 1. Whereas, if we suppose that Jesus had preached only a few weeks before the death of John, we may imagine, that, engaged as Herod was in a multiplicity of busines and pleasure, he might not have heard of him till that time; and therefore might, with some plausibility, conjecture, as he did, that he was John rife from the dead. This argument is considered by Dr. Priestley as almost conclusive against the common hypothesis. Moreover, all our Lord’s journeys, of which the Evangelists give any account, agree in no many circumstances, that they are evidently the same, and are supposed to be so by all harmonists. All his journeys to Jerusalem amount to no more than four; three of which, at least, every pious Jew was obliged to make in the compas of every year. John, who supplies many of the deficiencies of the other Evangelists, only makes up the number of them to four. Dr. Priestley considers the objections to this hypothesis, urged by archbishop Newcome and others, and endeavours to obviate them. He then arranges the leading events in the life of Christ, and points out the particular periods in which they occurred, together with the circumstances attending them; and calcures with a computation of the time that was necessary for the purpose of Christ’s ministry. He annexes a calendar, exhibiting the months and days that elapsed between the first of the Jewish month Nisan, answering to the 17th of March in the Julian computation, to the 30th of Nisan, corresponding to the 21st of April in the following year, together with the principal events that happened during each particular period. According to this calendar, Jesus be-
Jet has been often confounded with the common cannel coal, though a proper consideration of their distinguishing characters is sufficient to establish the difference between them.

Jet is always found in detached masses lodging in other strata; cannel coal constitutes of itself whole strata. Jet has the grain of wood, and splits horizontally much more easily than in any other direction; cannel coal has no peculiar grain, and splits with equal ease any way. Jet is but moderately hard, cannel coal not less so than many stones; and jet, when set on fire, flames a long time; cannel coal but a little while. Jet is found in Italy, Germany, and the East Indies, but no where so plentifully as in England; it is very common in Yorkshire, and other of the northern counties, and is found in many of our clay pits about London.

Mr. Farey remarks, that jet is perhaps only in England found imbedded in the alum flake strata of Yorkshire; of which numerous specimens are met with in the flake cliffs near Whitby, and at Huntcliff and Cleveland, as Dr. Grew mentions; although the alluvial clays, and the sands on the shores of most places on the eastern coast of England, produce specimens of jet. Near Leigh, and near Zucca, in Mecena, it is found in considerable quantities; and on the coasts of Baffian or Baffian, one of the Philippine Isles. Mr. Mawe, in his Mineralogy of Derbyshire, p. 92 and 93, mentions indurated bitumen found in that county which resembles jet.

Beckwold, a town in Utrecht, works first an acid liquor, then a thin, and afterwards a thick black oil. By friction it becomes electrical, as amber does. See Aspren.

Jet, in Medicine, was highly prized by the ancients, but the modern practice has never enquired whether jufily or not. Dioscorides tells us, that it is an excellent emollient and dilutent; he recommends the fumigation of it for defcades of the womb, and favs, that water, in which burnt jet has been quenched, is a cordial. Actius orders it to be extinguished in wine for the same purpose. It has been much used by the perfumers.

There is also a fictitious jet, made of glafs, in imitation of the mineral jet: this is now usually drawn out into long hollow threads, which are cut and fashioned at pleasure. It is much used in embroidery, and in the trimmings of mourning, and may be made of any colour, though it is usually black and white; and of late is denominated agate.

Jet d'Eau, a French word, signifying a fountain that calls up water to any considerable height in the air.

The velocity of a small jet of water issuing in any direction from a reservoir, is nearly equal, in favourable circumstances, to the velocity acquired by a body in falling through the height of the surface of the reservoir above the orifice. Supposing a very small plate of water, immediately within the orifice, to be put in motion at each instant by means of the whole pressure of the fluid, which is equal to the weight of a column on the same base, of the height of the reservoir; and supposing the whole pressure to be employed in generating the velocity of the thin stratum, neglecting the motion of the surrounding fluid, this stratum would be urged by a force as much greater than its own weight as the column is higher than its thickness, through a space which is shorter than the height of the column in the same ratio. But the spaces being inversely as the forces, the final velocities are equal; and the velocity then generated would be equal to that of a body falling through the height of the column. And although a part of the pressure of the column is expended in producing motion in its own particles, this part is not wholly lost, because the velocity of these particles renders them more easily actuated by the pressure of the succeeding column. Still, however, some deduction must be made for the lateral motions of the neighbouring particles, which tend rather to diminish the quantity of the discharge, than to lessen the actual velocity of the jet; the particles approaching, and even passing through the orifice obliquely, contract the diameter of the stream nearly in the ratio of 4 to 5, when the aperture is in a thin plate; but the velocity in the contracted part is only one-fortieth or one-fiftieth less than that which is due to the height.

Here we may observe, that the velocity of the discharge through different kinds of apertures may be found by multiplying the square root of the height in feet by a certain co-efficient; this, for the undiminished velocity, is \( \frac{A}{229} \); for an orifice imitating the form of the contracted stream, 7.8; for bridges with pointed piers, 7.7; for bridges with square piers, 6.9; for short pipes, from two to four times as long as their diameter, 6.6; for orifices in a thin plate, and for weirs, about 7. When the orifice is made between two reservoirs, the discharge is nearly in the same relation to the difference of their heights.

A jet of water issuing from an orifice of a proper form, and directed upwards, rises nearly to the head of the height of water in the reservoir. For it has been shown, that the velocity is nearly equal to that which is produced by the fall of a body through the height, and each of the particles may be considered nearly as a separate projectile.

If a jet issue horizontally from any part of the side of a vessel, landing on an horizontal plane, and a circle be described having the whole height of the fluid for its diameter, the fluid will reach the plane at a distance from the vessel, equal to that chord of the circle in which the jet initially moves. The horizontal velocity of the jet, being equal to that which is acquired by a body falling through the distance \( AB \) (Plate XIV. Hydraulics, fig. 1.), below the surface, would describe, in the time of falling through \( AB \), a distance equal to \( 2 AB \) (see Accelerated Velocity), and in the time of falling through \( BC \), in which the jet will reach the horizontal plane, a distance greater in the ratio of those times, or of the square roots of the spaces. Call \( A, C \); then \( 1 : A D : : A D : A B, A D' = A B, \) and \( A D = \sqrt{AB} ; \) therefore the times are as \( AD \) and \( CD \); but \( A D : CD = A : B D, \) and \( 2 B D, \) or \( DE \), will be equal to the space \( FC \) described by the horizontal velocity in the time of falling through \( BC \). See Hydraulic Laws of Fluids.

Notwithstanding what we have above stated, with regard to the ascent of a jet, it is well known that a jet d'eau will never raise water so high as its orrefrior; and, therefore, gives less water than if it went to the full height. Of this phenomenon there are several causes: the first is, that the velocity of the lower particles of the jet is greater than the velocity of the upper; and, therefore, the lower water strikes that which is next above it; and as fluids move every way, by their impulse widens and consequently shortens the column. Another cause is, that the water at the top of the jet does not immediately fall off, but forms a kind of ball or head, the weight of which depresses the jet; if the jet be a little inclined, it will play higher but be less beautiful: besides, the friction against the sides of the hole of the atrage, or spouting-pipe, will make a small jet rise to a half height than a larger one from the same reservoir. To remedy this inconvenience, the spouting holes should be increased in proportion to the height of the spouting water, provided that they are not made too wide for the pipe of conduct.
The fourth cause is the air's resistance, which is proportional to the square of the velocity, with which the water of the jets of different heights strike it: and, therefore, the deficiency in height being in the same proportion, a jet that plays with a double velocity will have that deficiency four times as great, &c. Thus, if a jet of five feet high lose one inch in height, by coming from a reservoir of five feet one inch high, a jet produced from a reservoir of ten feet four inches, will rise but ten feet; and in this manner a table might be easily formed shewing by what height of reservoirs jets of a determinate height may be produced. The following table shows in feet, and decimals of a foot, what jets will be produced by reservoirs of a determinate height.

Here the jet is supposed to be within 100 or 150 yards of the reservoir; but if the conduct-pipe much exceeds this length, it must be of a larger diameter than what is here assigned. Thus for jets from 1/4 of an inch to those of an inch and 1/4, and from reservoirs from 40 to 90 feet height, if the distance be 150 yards to 1/2 of a mile, the diameter of the pipe should be of fix inches; from 1/2 of a mile to two miles, it must be of seven inches; and from two miles to five, it must be of eight inches diameter for the same jet.

If it be required to keep any number of jets playing whose ajutages are given in diameter, by one common conduct-pipe, we must find the diameter of an ajutage equal to all the given ones. Thus if there be four ajutages of 1/4 of an inch diameter each, then the square of 1/4 is 1/16, which multiplied by the number of ajutages 4, makes 1/4; the square root of which is 1/2 = 1/2 = the diameter of the ajutage equal to all the four small ones. A pipe of conduct of 10 inches diameter will supply all the jets, as being a little more than fix times as great as the diameter of the one large ajutage now found. After this manner the dimensions of a conduct-pipe may be found in any other number of ajutages.

Referring to the greatest possible height, the part of the conduct-pipe at the ajutage should not turn up at right angles, but with a gentle easy curve; for the best structure of the ajutage, see Ajutage. See also Fountain. Defaguiler's Course of Exp. Phil. vol. ii. lect. vii. annot.

Jet Rings, annular pieces of jet of large dimensions, found in many parts of England, and esteemed Roman antiquities. They are of different kinds; some being plain, others wrought, but all of them are much too large for rugs. The smallest of them are three inches in diameter; yet the bore is not above an inch and a half, which makes them as much too small for the writ as they are too large for the fingers.

Jetaiba, in Botany, a name given by some authors to the trees which afford the gum anise of the flops.

Jetans, or Camanches, as the Spaniards call them, or Padoucas as they are denominated by the Pamees, in Geography, a powerful nation, entirely erratic, without the least species of cultivation, subsisting solely by the chase. Their wanderings are confined to the frontiers of New Mexico on the W., the nations on the Lower Red river on the S., the Pamees and Ofage on the E., and the Utahs, Kyaways, and various unknown nations on the N. Their nation, although entirely in the territories of the United States, is claimed exclusively by the Spaniards, and may be said to be decidedly in their interest. They are the only nation who border on the Spanish settlements, which that government
government treats as independent people. They are by the Spaniards reputed brave.

JETHLATH, or JETHLACH, in Ancient Geography, a town of Palestine, in the tribe of Dan. Josh. xix. 1, 2.

JETOUR, in Geography, a town of Hindostan, in Gujerat; 10 miles N. of Junagar.

JETSON. See Flotson.

JETTY, in Engineering, is the name for a small pier or projection into a river, for narrowing it and raising the water above that place. See Transactions of the Society of Arts, vol. xxv.

JETTY-built, in the Royal Dock-yards, is a name usually given to that part of a wharf which projects beyond the reet; but more particularly the front of a wharf, whose side forms one of the cheeks of a wet or dry dock.

JETZ, in Geography, a town of Japan, in the island of Niphon; 84 miles N.N.E. of Meaco.

JEU, Fr. in Music, the action of playing upon an instrument. See Jouer.

Plein-jeu and demi-jeu are often used by the French for forte and piano.

JEV, in Geography, a town of Germany, and capital of a country called "Jeverland," situated in the N.E. part of East Friesland, on the W. side of the mouth of the Weser, which belongs to the prince of Anhalt-Zerbst; 28 miles N.E. of Emden. N. lat. 53° 30'. E. long. 7° 53'.

JEUNE, CLAUDE, J. in Geography. See Claudin.

JEUREV-POLSKAI, in Geography, a town of Russia, in the government of Vladimir; 32 miles N.N.W. of Vladimir.

JEUX, Fr. See Games.

JEUX d'Orgues, Fr. flops of an organ.

Prellant unison with the Open diapason
Bourdou double bafé Bordon
Bombarde bafe to the hautbois Bafloon
Nazard octave of the 5th Twelfth,
Tercie double octave of the Tierce,
{ sharp 3d Tierce,
Larget Octave of the 
Voix angélique octave of the Vox humana.

Many of the names of flops in French organs are the same as in English organs' built by Renatus Harris soon after the restoration: such as the flute, tierce, larget, cornet, furniture, trumpet, vox humana, or vox humaine, cornome, clarion, &c. We shall give English equivalents to the reet in the article Organ, where will be found a list of the flops in the famous organ at Haerlem.

JEW-BILL, in Law, is the famous statute 26 Geo. II. cap. 26, which enabled all Jews to prefer bills of naturalization in parliament, without receiving the sacrament, as ordained by lat. 7 Jac. I. This act was repealed by 27 Geo II. c. 1.

JEWEL, any precious stone, or ornament befit with them. (See DIAMOND, RUBY, &c.) The use of jewels prevailed to a great degree, and at an enormous expense, among the Jews, Greeks, and Romans; and has continued in various nations to this day.

JEWEL, JOHN, in Biography, a learned prelate of the churches of England, and zealous champion for the Protestant cause, descended from a very respectable family, was born at Buden, in Devonshire, in the year 1522. He received at different schools, in his own county, the elements of a learned education, and before he was fourteen years of age we find him at Merton college, Oxford, where he made great progress in the learning of the place, and was at the same time initiated in the principles of the reformed religion. In the year 1539, he removed to Corpus Christi college, of which he had been elected a scholar, and in the following year he took his first degree. Soon after he commenced tutor with high reputation, and contributed much to promote the reformation, by privately instructing his pupils in Protestant principles. Mr. Jewel, at this period, though looked up to by his contemporaries on account of his great learning, was not more celebrated for his literary acquirements, than he was for eminent piety, and the exemplariness of his manners. In 1544, he was admitted to the degree of M.A., and upon the accession of Edward VI. in 1546, he openly avowed himself a Protestant, and embraced every opportunity which offered itself to promote the progress of the reformation, both in his college lectures, and in private conversation. He obtained some church preferment, and his talents as a preacher procured him great acceptance, and general applause. The zeal which he displayed during the whole of king Edward's reign, to diffuse Protestant principles, occasioned his being one of the first victims to the resentment of the Papists upon the accession of Mary. It was in Mary's reign he was impeached before the council of his college, but so high did he stand for real talent, that he was at the same time appointed the orator of the place, and actually employed to draw up a congratulatory address upon the accession of the new queen. It has indeed been thought, that this appointment was intended for the purpose of ensnaring him, either by rendering him odious to his own party, if he accepted it, or by provoked the enmity of the Catholics, if he refused it. Mr. Jewel, however, disappointed his enemies, for the address which he drew up on the occasion was worded by him in such respectful and guarded terms, that it gave no offence to either party, and was favourably received by the queen. Mr. Jewel now withdrew from the impending storm, but his enemies followed him, and being urged with the threat of a cruel death, his fortitude forsook him, and he forsook his belief of doctrines which his understanding rejected, and his heart abhorred. Black carols were sung about him, and the furious Bonner was resolved, if possible, to attain the object of his wishes, but after encountering a thousand hair-breadth escapes, he was safely landed on the Continent, and thus freed from the perils which threatened him. He immediately proceeded to Frankfort, and made a public confession before the English exiles in that city of his sincere contrition on account of his late subversion, begging pardon of God, and of the church, for the weakness which he had discovered in that transgression. After a short stay at Frankfort, he went to reside with his old friend Peter Martyr at Stralburg, whom he accompanied to Zurich, where he extracted from the publication of some of his writings, and in the composition of his theological lectures. On the death of queen Mary, Mr. Jewel returned to his native country, and was graciously received by queen Elizabeth, who appointed him one of the sixteen divines selected to hold a public disputation in Westminster abbey, upon the principal points of controversy between the Protestants and Papists. He was also commissioned with others to visit certain dioceses in the western parts of England, with the view of eradicating Popery from them, and in the year 1560, he was promoted by his sovereign to the bishopric of Salisbury. He was incessant in the work attached to his office, and was literally worn out in the duties which he conceived to belong to the pastoral office. He died in September 1571, at Monkton-Farley, in Wiltshire, when he was in the fiftieth year of his age: he was author of a vast number of works, many of which are
JEW

full held in high estimation. They were collected and printed uniformly in 1600, and some of his letters are preferred in Bishop Burnet's History of the Reformation. He was one of the most eminent scholars among the reformers: was a great proficient in the learned and in some of the modern languages: he had a strong memory, which he improved by art, that he was able to repeat most exactly what he had written after once reading it. Biog. Brit.

JEW - Blocks, in a Ship, are two small blocks, which are suspended at the extremity of the main and fore-top-sails, by means of an eye-bolt, driven from without into the middle of the yard-arm, parallel to its axis. The use of these blocks is to retain the upper part of the top-mast-flattening-fails beyond the flights of the top-sails, so that each of these falls may have its full force of action, which would be diminished by the incroachment of the other over its surface.

JEW'S MALLOW. See CONCORUS.

JEW'S STONE, in Natural History. See LAPIS JUDÆICUS.

JEW'S STONE, in Mining, signifies bafalt, win, or trap, in the colleries of Shropshire. See Pymble's Report on the Agriculture of that Country, p. 61, &c.

JEWS, in Geography and History, an appellation which, in its most extensive sense, comprehends all the descendants of the celebrated patriarch Abraham, who was the father and founder of the Jewish nation; but, in its more restricted sense, it includes those who belonged to the tribe of Judah, and who inhabited Judæa. Although they have been usually distinguished by this denomination, it is a name that was not given them till after the Babylonish captivity, when the tribe of Judah became the most considerable of what was left of Israel. In preceding times they were denominated Israelites, or more commonly Hebrews. For the etymology of this latter appellation, see HEBRE. Under this title they occupied the Land of Canaan, (which see,) whether their progenitor Abraham had migrated, and where he settled in the year B.C. 1921. (See ABRAHAM.) The subsequent possessors of it were the Israelites, so denominated from the name of Jacob, among whose 12 sons, forming so many distinct tribes, it was partitioned in the manner already stated under the article Land of Canaan. (See also JUDAH, JUDEA, and PALESTINE.) When the patriarchal government, which seems to have subsisted in the early ages of the world, became impracticable (see PATRIARCHAL); the form of the Hebrew government underwent a material change, and was subject to various revolutions from the commencement of the national polity of the people of Israel, or Jews, to its final dissolution. While they journeyed in Egypt, it is natural to imagine, that as long as Jacob and Joseph lived, they were their own masters, and were governed by their own laws; and though they were afterwards enslaved by the Egyptians, they nevertheless had some form of civil government among them, exercised by persons under the denomination of Elders; who are supposed to have been the wiseft and greatest men, in the highest estate among them, or, as Mr. Selden conjectures, the heads of their tribes. During their migration through the wilderness, from Egypt to Canaan, theocracy was established. (See THEOCRACY.) As God was their king, Moses was his vice-roy, in whom the supreme power, ecclesiastical as well as civil, under God, was lodged. By him Aaron and his sons were put into the priesthood; the royal palace, or tabernacle, was built by his direction: by him it was consecrated; he gave the nation the whole body of their laws; he was the High-priest in chief of all their forces. Whatever Moses did, he did by commission from God; and though he was only God's lieutenant or vice-roy, he was, on account of an authority, which he held only in subordination to God, called king in Jehovah. (Deut. xxxiii. 5.) Upon the entrance of the Israelites into the land of Canaan, B.C. 1451, under the conduct of Joshua, he became, in consequence of an oracular appointment, and in consequence of having been invested with the office, while Moses was living, the successor of Moses. (Numb. xxvii. 15—23.) And after his death, the people acknowledged Joshua for his successor, stipulating to render him that obedience which they had paid to Moses. (Josh. i. 16, 17.) In the year B.C. 1445, Joshua divided the land of Canaan among the 12 tribes; and died in the year B.C. 1426. Some have said that Joshua was succeeded by the Judges. But it has been doubted, and not without reason, whether the Judges were properly successors to Joshua in the same office, as he had been to Moses. The legislative office which Moses had posteriorly having expired at his death, so, it is said, did the office of Joshua, at "præfectus ordinarius," and captain-general for his life, at his. Upon this the Hebrew government became aristocratical; excepting that, in respect to the peculiar supremacy of Jehovah, it was monarchical. In the Hebrew commonwealth every city had its elders, who formed a court of judicature, with a power of determining lesser matters in their respective districts. Each tribe had also its respective prince; these are called the heads of the thousands of Israel (Numb. x. 4.), and were, perhaps, the same with the 12 captains of the host, mentioned in the 2d chapter of Numbers; and their office, therefore, related chiefly, if not entirely, to military affairs. We also read of the princes of the congregation, who presided in judicatory matters. (Numb. xxxii. 2. Josh. ix. 15, xviii. 4.) They are called elders, princes, and nobles, on account of the dignity of their office (Exod. xxiv. 9. 11.), and they were 70 in number. (Numb. xxi. 16, 17; 24, 25.) See SASHEDRH. As for the judges, of whom we read after the death of Joshua, they seem to have been appointed only on particular occasions; but were not "præfecti ordinarii," like Moses and Joshua; nor were they continued in their office during life, but only as long as there was occasion for their service. (See Judges.) The first of these judges was Othniel, who, in the year B.C. 1405, the 40th year after the peace established in the land by Joshua, gave rest to Israel. The 2d judge was Ehud the Benjamite, B.C. 1335; he was succeeded by Deborah the prophetess, B.C. 1255, who with Barak the general of the Israelites defeated the Canaanites under Sisera: the 4th judge was Gideon, B.C. 1235, who routed the Midianites, but declined the office of king. The 5th judge was Tola, B.C. 1233: the 6th was Jair, B.C. 1210: the 7th was Jephthah, B.C. 8—1189.
Jews.

1183: the 8th was Ibzan, B.C. 1182; the 9th was Elon, B.C. 1175; the 10th was Abdon, B.C. 1165; the 11th was Ehi, the high priest, B.C. 1157; the 12th and last judge was Samuel, B.C. 1116. (See Captivity.) We have here followed the chronology of Blair's Tables. The Judges were succeeded by kings, who reigned for two centuries; and those that reigned over the whole Hebrew nation, and were only three, Saul, David, and Solomon; and those that reigned over some of the tribes only. Saul began his reign in the year B.C. 1055, and having reigned 40 years, was succeeded by Ishboliah his son, who reigned seven years over part of Israel; and had for his successor David, who was anointed to be king after Saul by Samuel, B.C. 1093, and who became sole king, B.C. 1048. Having reigned wholly and in part 40 years, he was succeeded by his son Solomon, B.C. 1015, who died B.C. 975. After his death the kingdom was divided. The kings of the house of David, beginning with Rehoboam, were 20 in number, if we reckon Athaliah the queen, who usurped the throne for six years, after the death of her son Ahaziah. (2 Kings, x.) Those kings reigned over the two tribes of Judah and Benjamin, until Nebuchadnezzar carried Zedekiah, the last of them, captive to Babylon, B.C. 587. They took their title from the larger tribe, and were called kings of Judah. The kings of Israel, who reigned over the other ten tribes, from the time of their rebellion against Rehoboam, the son of Solomon, to the Assyrian captivity, were of several different families, and were in all 19 from Jeroboam, the first, B.C. 975; to Hosea or Hosea, the last, B.C. 721, when the Israelites were carried into captivity, and their kingdom terminated after a duration of 253 years.

As the Hebrew nation was divided into two distinct kingdoms, so each kingdom suffered a distinct captivity; the one called the Assian, the other the Babylonian. For an account of each, see Captivity.

When Cyrus, having conquered Babylon, and almost all the western parts of Asia, issued a decree B.C. 536, for the return of the Jews from their captivity and the rebuilding of their temple; many of them, particularly of the tribes of Judah and Benjamin, gladly availed themselves of the liberty; and some, even of the ten tribes, joined themselves to the rest, and returned with them to their own land. Many, however, chose to remain where they were; and indeed had been already so widely dispersed during the years that had elapsed since the Assyrian captivity and formed permanent settlements, that they had neither opportunity nor inclination for returning with their brethren. Many enquiries have been made concerning the dispersed Jews of the ten tribes; and it has been till of late a prevalent opinion, that they were either wholly lost, or that they had at different times found their way in detached bodies to their own country. In consequence of some late discoveries, there is reason to believe, that they still exist in various parts of the East. Under the articles Ashians and Captivity, we have already stated the result of some enquiries with respect to the Jews of these tribes; and we have derived farther information from the researches of the Rev. Dr. Claudius Buchanan, lately published, Cambridge, 1811. Whilst this author was in the East, he heard that Jews existed in distant colonies in certain parts of India; that some of them had arrived there long before the Christian era, and had remained in the midst of the Hindoos to this time a distinct and separate people, perfecuted by the native princes from age to age, and yet not destroyed. The author also noticed the existence of an ancient colony of Jews on the coast of Malabar, particularly at Cochin. Being at Cochin in February 1807, he formed an acquaintance with the Jews; and found that they live in a town about a mile distant from Cochin, called "Jews' Town." It is almost wholly inhabited by the Jews, who have two respectable synagogues. Jews from remote parts of Asia reside here, and as they have constant communication by ships with the Red sea, the Persian gulf, and the mouths of the Indus, this place is the fountain of intelligence concerning the people in the East. The refustant Jews are divided into two choises, called the "Jewish Jews," and the "Ancient or Black Jews." The former reside at this place; the latter have also a synagogue here, but the great body of that tribe inhabit towns in the interior of the province. With regard to the history of the White Jews, our author obtained a written narrative, in the Hebrew language, of their arrival in India, which has been handed down to them from their fathers; and they exhibited to him an ancient brass plate, containing their charter and freedom of residence, given by a king of Malabar. Of their first arrival this narrative records, that after the destruction of the second temple, their fathers, dreading the conqueror's wrath, departed from Jerusalem, a numerous body of men, women, priests, and Levites, and came into this land. They had among them many of reputation for learning and wisdom; and God gave them a favour in the sight of the king who then reigned here, and he granted them a place to dwell in, called "Cranganor." He allowed them certain privileges, and the royal grant was engraved on a plate of brass. This was done in the year from the creation of the world 4257 (A. D. 493); and this plate of brass is still in their possession. "Our forefathers," they say, "continued at Cranganor for about 1000 years, and the number of heads who governed were 72. Soon after our settlement, other Jews followed us from Judea; and among these came that man of great wisdom, Rabbi Samuel, a Levite of Jerusalem, with his son Rabbi Jaluda Levi. They brought with them the "silver trumpets," made of a at the time of the "Jubilee," which were faved when the second temple was destroyed; and we have heard from our fathers, that there were engraved upon those trumpets the letters of the ineffable name. There joined us also from Spain and other places, from time to time, certain tribes of Jews who had heard of our prosperity. But at last, discord arising among ourselves, one of our chiefs called to his assistance an Indian king, who came upon us with a great army, destroyed our houses, palaces, and strong holds, dispersed us of Cranganor, killed part of us, and carried part into captivity. By these massacres we were reduced to a small number. Some of the exiles came and dwelt at Cochin, where we have remained ever since, suffering greater changes from time to time," &c. &c. The native annals of Malabar confirm the foregoing account in the principal circumstances; as do the Mahometan histories of later ages; for the Mahometans have been settled here in great numbers since the eighth century.

Our author farther informs us, that by looking at the countenance of the "Black Jews," you may be satisfied that their ancestors must have arrived in India many ages before the "White Jews." Their Hindoo complexion, and their very imperfect resemblance to the European Jews, indicate that they have been detached from the parent stock in Judea many ages before the Jews in the West; and that there have been intermarriages with families not Israel. The White Jews look upon the Black Jews as an inferior race, and as not of a pure cast; and this circumstance plainly demonstrates, that they do not spring from a common stock in Judea. The Black Jews gave our author much interesting information; and recounted the names of many other
small colonies resident in Northern India, Tartary, and China, and gave a written list of 65 places. Upon inquiring of them concerning the ten tribes, they said that it was commonly believed among them, that the great body of the Israelites are to be found in Chaldea, and in the countries contiguous to it; being the very places whether they were first carried into captivity; that some few families had migrated into regions more remote, as to Cochin and Raja-poor in India, and to other places yet farther to the East; but that the bulk of the nation, though now much reduced in number, had not to this day removed 2000 miles from Samaria. Our author afterwards made a tour through the towns of the Black Jews, in the interior of the country, Tritori, Paroo, Cherotta, and Malch; and he found many MSS., chiefly in the Rabbinical character. One of these is an old copy of the books of Moses, written on a roll of leather. The skins are fewed together, and the roll is about 48 feet in length. Some of the Jews suppose that this roll came from Senna, in Arabia; others have heard that it was brought from Casmire. The Cabul Jews, who travel into the interior of Chins, say, that in some fynagogues the law is still written on a roll of leather made of goats' skins dried red; not on vellum, but a soft flexible leather.

Whilst our author was amongst the Jews of Malabar, he made frequent inquiries concerning the ten tribes. When he mentioned, that it was the opinion of some that they had migrated from the Chaldean provinces; he was asked to what country we supposed they had gone, and whether we had ever heard of their moving in a great army on such an expedition. It will be easy perhaps to shew that the great body of the ten tribes remain to this day in the countries to which they were first carried captive. We learn from Josephus, who lived in the time of Vespasian, and who recites a speech made by king Agrippa to the Jews, exhorting them to submit to the Romans; that the ten tribes were then captive in Media under the Persian princes, and Jerome, in the fifth century, treating of the dispersed Jews in his notes on Hosea, says, unto this day the ten tribes are subject to the kings of the Persians, nor has their captivity ever been loosed. And again, the ten tribes inhabit at this day the cities and mountains of the Medes. No family dares to leave the kingdom of Persia without permission of the king. In the provinces of Casmire and Aghanistan, some of the Jews submitted to great sacrifices, and remain Jews to this day; but the greater number yielded, in accordance of ages, to the power of the reigning religion. Their countenance, their language, their names, their rites and observances, and their history, all conspire to establish the fact. Mr. Forster (Travels) was so much struck with the general appearance, garb, and manners of the Casmirians, as to think, without any previous knowledge of the fact, that he had been suddenly transported among a nation of Jews. The tribes of the Afghan race are very numerous, and of different castes, extending on both sides of the Indus, and the mountainous region, which commences in Western Persia: some of these tribes are evidently of Jewish extraction. Our author, however, concludes upon the whole, that the greater part of the ten tribes, which now exist, is to be found in the countries of their first captivity. But to return from this digression—

Although none of the ten tribes returned on the occasion above-mentioned, most of them remained amongst the heathens. This appears to have been the case in the reign of Artaxerxes Longimanus, supposed by Prideaux to be the Alauiferus mentioned in the book of Esther, and this must have been nearly eighty years after their first return in the reign of Cyrus, B.C. 458. It was at this time that Ezra obtained an ample commision from Artaxerxes for his return to Jerusalem, with all of his own nation who were willing to accompany him. (Ezra, ch. vii.) Upon this many more of the Jews returned to their own land. Nevertheless, few of the ten tribes, in comparison of those of Judah and Benjamin, ever returned from their dispersion. It appears, that at the time of Haman's conspiracy, probably four or five years after the second return under Ezra, there was a multitude of the Jews dispersed through the various provinces of the Persian empire; besides those who had mingled with idolaters and embraced their religion. Ezra, who was governor of the Jews in their own land for thirteen years, was succeeded by Nehemiah, who had a new commission granted him by Artaxerxes in the 22d year of his reign, B.C. 445, with full authority to repair the wall of Jerusalem, and to fortify it in the same manner as before it was dismantled by the Babylonians.

The Jews, who, after the return from the captivity, were settled again in their own land, were no longer divided into two kingdoms, but formed one people under one government, which varied in its form through several succeeding ages. Upon their return from the captivity, Judea became a province of Syria, tributary to the sovereign of the Persian empire. But though tributary, the Jews enjoyed their own religion, and were governed by their own laws; and their governors, though they acted by virtue of a commission from the court of Persia, were, nevertheless, of their own nation; as Zerubbabel, Ezra, and Nehemiah; so that the administration of the Jewish state was committed to their high-priests. This state of things, and this form of government, continued for upwards of 200 years, until the time of Alexander the Great, who, having destroyed the Persian empire, B.C. 331, and established the Grecian universal monarchy, reduced the Jews into a state of subjection to him and his successors. But they were not properly conquered by him, as the other nations were; but obtained his protection in the singular manner related by Josephus, Antiq. l. xi. c. 8. 5. 3—5. edit. Havre. (See Jerusalem.)

Jaddua, the Jewish high-priest, having ingratiated himself with Alexander by his prudent conduct, and by shewing him the prophecies of Daniel, which predicted the overthrow of the Persian empire by a Grecian king; and being ordered to request on behalf of the Jews whatever was agreeable to them, petitioned that they might enjoy their own laws and religion, and be exempted from paying tribute every fourth year, because in that year they neither sowed nor reaped. All this was freely granted by Alexander. After the death of Alexander, the Jews became subject and tributary to the kings of Egypt or Syria, as by various events one or the other extended their dominion to Judea, which lay between these two countries. After a severe contest, Judea was subdued by Ptolemy, and 100,000 Jews were made captive; but afterwards, reflecting on their accumulated fidelity to their conquerors, he restored to them all the privileges which they had enjoyed under the Macedonians. Five years after the subjugation of Judea by Ptolemy, he was forced to surrender it to Antigonus, the Macedonian general, who treated the Jews in a manner so tyrannical, that many of them fled into Egypt, and others put themselves under the protection of Seleucus Nicator, king of Syria, who granted them considerable privileges. At this time Judea seemed to be in danger of depopulation, till it was recovered by Ptolemy Soter in the year B.C. 262. The prosperity of the Jews, however, was of short duration; for under the reign of Ptolemy Philopator they were grievously oppressed by the incursions of the Samaritans, whilst Antiochus Theos, king of Syria, invaded Galilee. Antiochus, however,
ever, was defeated by Ptolemy, who, being refuted by the Jews in his attempt to profane the temple, raised against them a dreadful persecution; but this persecution being flapped, the Jews were again received into favour. When Ptolemy Epiphanes succeeded his father Philopator, B.C. 224, Antiochus, the great king of Syria, invaded Palestine; and the Jews, unmindful of their obligations to the kings of Egypt, joined the invader. In recompence of the services which they rendered him, Antiochus proposed to restore their metropolis to its ancient splendour, liberty, and privileges; and to recall all those Jews who had been driven out of it; and from singular respect to the temple of their God, he granted them 20,000 pieces of silver towards the charges of their worship, 1400 measures of fine wheat, and 375 measures of salt, for their usual obligations. He also declared his intention to repair the temple at his own coi, to allow them the free exercise of their religion, to restore the public service, and the priests, Levites, &c. to their usual functions; and besides other privileges which he conferred upon them, he granted an exemption from all taxes for three years to all the dispersed Jews that should come within a limited time to repossess that metropolis. By these and other extraordinary favours, Antiochus so attached the Jews to his interest, that Judea, and the other neighbouring provinces, readily submitted to him. Upon the death of Antiochus, their friend and protector, B.C. 187, they found as kind a patron in his son and successor, Seleucus Philopator. Judea at this time enjoyed a profound peace, and their laws were observed with great strictness under their worthy high-priest, Onias III., until a misunderstanding, which occurred between him and Simon, a Benjamite, who had been made governor of the temple, brought a series of evils on the Jewish state. Simon treacherously communicated information to Seleucus, that the temple of Jerusalem contained immense treasures, which might be seized for his use. Heliodorus was dispatched to Jerusalem for this purpose; and having acquainted Onias with the king's orders, which he was commissioned to execute, the priest remonstrated, and endeavoured to dissuade him from any attempt of this kind. Heliodorus, however, endeavoured to force the temple, but whilst the Syrians were endeavouring to enter, they were smitten with such a panic, that they fell down half-dead. When the traitor Simon found that he had misfired his aim, he laid the whole blame on the good high-priest, pretending that he was the person who had called Heliodorus to Jerusalem, and thus raised a party against him. Onias, fearing the consequences of such a faction, went to Antioch to complain of this outrage to the king. He was well received, and Simon was banished; but Seleucus, dying soon after, B.C. 175, was succeeded by his son Antiochus Epiphanes, generally supposed to be that " vile perfom," of whom Daniel prophesied under that appellation (chap. xi. 21, &c.); and he actually proved altogether as profane and cruel as the prophet represents him; for he laid siege to Jerusalem, and took it by storm, and in the course of two days massacred 40,000 of its inhabitants, and sold as many more to the neighbouring nations for slaves. He impiously found his way into the temple, and into the holy of holies; he sacrificed a great cow upon the altar of burnt-offerings, and cauded broth to be made of some part of the flesh, and to be sprinkled all over the temple. He afterwards plundered the sacred edifice of all its golden and silver vessels and utensils, to the value of 1860 talents of gold; and having made a similar plunder in the city, he left it; after he had, to the further vexation of the Jews, appointed Philip, a Hellen, to be their governor, who was a man of a cruel and barbarous temper; and the apostle Menelaus, the brother of Onias, who had been safely murdered, in the possession of the high priesthood, B.C. 170. It would be tedious to enumerate the horrid acts of cruelty which were committed under the authority and direction of Antiochus, than whom we most conceive a greater monster of barbarity. Not satisfied with the savage and brutal measures that were executed against the Jews, he determined either totally to abolish their religion, or to exterminate their whole race. Accordingly he issued a decree, that all nations within his dominions should conform to his religion, and worship the same God, and in the same manner that he did, under the severest penalties. This decree being levelled chiefly against the Jews, he sent commissioners to execute it in Judea. One of these, named Apelles, came to Modon, where dwelt Mattathias, a very honourable priest, and zealous for the law of his God; he was the great-grandson of Aemonomus, from which circumstance the family probably derived the name of Aemonomes. This Mattathias, with his five sons, were tempted, by the most ample promises of protection and favour, on the part of the king, to renounce their religion. But he contended the offer, and magnanimously declared, that if the whole Jewish nation, and even the whole world, were to conform to the king's edict, he and his sons would continue faithful to their God to the last moment of their lives. At the same time, receiving one of his countrymen just going to offer sacrifices to an idol, he fell upon him and instantly killed him, agreeably to the requisition of the Mosaic law in cases of that kind. Upon this, his sons, actuated by similar zeal, killed the king's officer and his men; overthrew the altar and idol; and running about the city, cried out, that those who were zealous for the law of God should follow them. They then retired into the mountains, whither they were followed by many of the Jews; and having there formed an army, stood upon their defence. Afterwards, leaving their fastenesses, they went about the country destroying the heathen altars and idolaters, and reforming the worship of God according to the law, wherever they came. Mattathias, who died B.C. 166, was succeeded by his son Judas, surnamed Macabæus, who was one of the most distinguished heroes of whom the Jews can boast. His army consisted only of 6000 men; but the deficiency of number he supplied by his zeal and bravery. Of his signal exploits and various conquests, we cannot here give a minute detail. It must suffice to observe, that having rid the province of Judea of the enemy, he marched to the metropolis, purified the city and temple, restored the altars, holy place, and worship; commencing the religious service with the dedication of the new altar, and other holy utensils, which was performed on the 25th day of the month Cilles; the same day in which it had ceased by the profanation of the temple three years before, and in the second year of Judas's government. The news of Judas's success exasperated Antiochus Epiphanes almost to madness: and he still retained his purpose of extirpating the Jewish race. But he had scarcely uttered his purpose, before he was seized with a pain in his bowels of the most excruciating nature, and this disease, accompanied with still more agonizing reflections and feelings of mind, terminated in his death, B.C. 164. Judas still purged his successful military operations; till at length the Syrians were under a necessity of suing for peace, B.C. 163. This year, in Blair's Tables, is the era of the government of Judea by the Aemonomes or Maccabees, which lasted 126 years. The peace between the Syrians and Judas was of short duration. Upon the renewal of the war, Judas defeated them in five engagements; but in the 6th he was abandoned by all his men except 800 who, together with
their chief, were slain in a severe contest, which lasted from the morning till evening, B.C. 161. The Jews were much affected by the death of Judas. He was succeeded, however, by his brother Jonathan, who conducted their concerns with no less prudence and success than Judas, till, after having governed the Jewish state near 17 years, he was defeated in the power of Tryphon, a Syrian usurper, and soon after murdered, B.C. 144. Simon, the only surviving son of Mattathias, succeeded his brother Jonathan: whom frustrated all the hostile designs of the traitor Diodotus, called Tryphon, against Judaea. Simon was not only appointed commander-in-chief of the forces of the Jews, but promulgated the dignity of high-priest, in which office he was legally installed. This pontiff renewed the alliance with Rome and Sparta; repaired and fortified all his garrisons, especially that of Bethfura, on the confines of Judea; took Joppa and Gaza; and drove out the Syrian garrison from Acre, the fortress of Jerusalem. The wife of Demetrius, who had been driven from his dominions, and kept prisoner by the Parthians, despairing ever to recover her captive husband, invited his brother Antigonus to make an effort for reconquering the Syrian crown. Upon his arrival, he sent a very obliging letter to the Jewish high-priest, in which he confirmed him in all his dignities, revenues, and authority; and to his nation all the freedom and immunities which had been formerly granted by his brother to them, or which they now actually possessed. To this he added, besides many great promises, a power of coining their own money in Judaea, of which that pontiff immediately availed himself. But when that prince had established himself on the throne by the marriage of Cleopatra, and the death of Tryphon, Simon, either suspecting the sincerity of his late promises, or being conscious of making his friendship to him appear more considerable, sent a fresh embassy to Rome, to renew and strengthen his alliance with that nation. Simon was at last treacherously murdered by his son-in-law Polemy, about the year B.C. 135. The successor of Simon, both as prince and high-priest, was his son Hyrcanus, who immediately adopted measures for the safety of his own person, as well as that of the city and country. Having succeeded in throwing off the Syrian yoke, he turned his arms against the Samaritans, took their capital Samaria, made himself master of Palestine, and added to it all the provinces of Samaria and Galilee; all which he enjoyed to the end of his life. His reign was no less remarkable on account of his great wisdom and piety at home than his conquests abroad. Never did the Jewish religion or commonwealth appear with greater lustre than during the captivity; but that which raised his glory above any of his predecessors, or successors, was, if we may believe Josephus (Bell. Jud. I. ii. c. 3), and the 4th book of Maccabees, his enjoying three dignities, which never all concurred in any one beside himself; viz. the royal dignity, the high-priesthood, and the gift of prophecy. Of the last-mentioned, however, the evidences that are produced are very equivocal and liable to great suspicion. The last year of Hyrcanus's reign was much embittered by a quarrel with the Pharisees, to whom he had been always partially attached; and this contention is thought to have shortened his days. One of the Pharisees suggested a doubt of his legitimacy, alleging that his mother had formerly been a slave, and consequently, that he was incapable of enjoying the high-priesthood. This report was credited, or at least pretended to be so, by the whole sect; and it irritated Hyrcanus to such a degree, that he joined the Sadducees, and could never afterwards be reconciled to the Pharisees, who occasioned all the troubles and seditions that disturbed the closing period of his life. Hyrcanus died in the year B.C. 107; and was succeeded by

his son Aristobulus, who manifested himself to be a most cruel and barbarous tyrant. His reign was happily of short duration; for in the year B.C. 106, he was succeeded by his brother Alexander Jannæus, who, was next to King David, the greatest conqueror that ever sat on the Jewish throne. His abode at Jerusalem was rendered very undesirable by the tumults excited by the Pharisees; and he therefore left the city to such foreign enemies and conquerors. During his absence the Pharisees raised a rebellion at home, which was terminated in the year B.C. 86, when the rebels were treated with great inhumanity. Alexander, having made several conquests in Syria, died in the year B.C. 79. Although he left two sons, Hyrcanus and Aristobulus, he bequeathed the government of the kingdom to his wife Alexandra during her life, and then to either of his sons whom she might think proper to appoint. The Pharisees disquieted her administration; and nothing less would satisfy them than the total extermination of their adversaries, the Sadducees, who were grievously perfecuted for four years, and then, for their future security, dispersed among the several garrisons of the kingdom. When her death seemed to be approaching, Aristobulus collected a party to secure the crown to himself; but the queen, having before made Hyrcanus high-priest, appointed him to succeed her in the royal dignity. At her decease, the left her two sons competitors for the crown. In a contest between the two brothers, Hyrcanus was compelled to abandon all title both to the royal and pontifical dignity. His party, however, was not extinguished. Antipater, father of Herod the Great, took part with Hyrcanus, and having carried him off into Arabia, under a pretence that his life was in danger in Judea, he interred Aretas, king of that country, in his behalf; who, with a view of removing him to the throne, invaded Judea, and defeated Aristobulus. This prince had recourse to the Romans, who, under the command of Scævola, defeated Aretas, with the loss of 7000 men, and drove him out of the country. The two brothers afterwards appealed to Pompey, who was at that time commander-in-chief of all the Roman forces in the East, and made him the arbitrator of their differences. He deferred giving an opinion, with a promise that, as soon as he had subdued Aretas, he would come into Judea and divide the controversy. Aristobulus was offended, and on the other hand Poltemy referred the want of respect on his part, and, entering Judea with his troops, summoned Aristobulus to appear before him. From the behaviour of Pompey, Aristobulus perceived that he was in the interest of his brother, and accordingly he fled to Jerusalem, with a design of exciting himself to the utmost of his power against the Romans. Pompey followed him, and soon brought him to abject submission. The citizens of Jerusalem demurred, and the garrisons shut the gates against Pompey. Exasperated by this conduct, he besieged and took the city, B.C. 63, and restored Hyrcanus to the priesthood and absolute government, with the title of "Prince," but forbidding him to assume that of "King," to wear a diadem, or to extend his territories beyond the limits of Judea. Pompey, having thus subdued the Jewish nation, set out for Rome, and carried with him Aristobulus, with his two sons, Alexander and Antigonus, and his two daughters, to adorn his future triumph. Alexander, however, found means to make his escape into Judea, where he raised an army, and having fortified some strong holds, made incursions into the neighbouring country. Hyrcanus sunk into his natural indolence, and left the management of public affairs to Antipater, who, for purposes of personal and family aggrandizement, ingratiated himself with the Romans. Hyrcanus was in no condition to oppose Alexander; and therefore
fore again besought the affiance of the Romans. Alexander ventured a battle, and was defeated; but, by the intercess of his mother with the Roman general, obtained a pardon for his past aggressions. Hyrcanus was again restored to the pontifical dignity: and the province was divided into five districts, having each a separate court of judicature. The first of these was at Jerusalem; the second at Gadara; the third at Amath; the fourth at Jericho; and the fifth at Sefporis in Galilee. The government of Judea was now changed into an aridocracy. The war between Pompey and Cæsar afforded the Jews some reprieve; and favoured the ambitious projects of Antipater. Cæsar confirmed Hyrcanus in his priesthood; added to it the principalities of Judea, which was entailed on him and his posterity for ever; and restored the Jewish nation to their ancient rights and privileges; and soon after, when Cæsar himself came into Judea, he granted liberty to fortify the city, and to rebuild the wall which Ptolemy had demolished. During the life of Cæsar the Jews were highly favoured, and might be said fearlessly to feel the Roman yoke; but after his death, B. C. 44, their condition underwent a material change. Antigonus, son of Aristobulus, brother of Hyrcanus, by means of some friends he had among the Jews, and by the affiance of the Parthians, made himself master of Jerusalem and all Judea, and took Hyrcanus prisoner, who was put into the hands of the Parthians. This circumstance, and several others occurred, which embroiled Judea; nor were the tumults and disorders of this province quelled till Herod visited Rome, and was created king of Judea by the friendship and interest of Marc Antony and Octavius, in the year B. C. 40. The view of Herod, in his journey to Rome, was to obtain the kingdom of Judea for Aristobulus, brother of his wife Mariamme, by his father, grandson of Aristobulus, and by his mother, of Hyrcanus. But the Senate of Rome, by the recommendation above-mentioned, and also moved by some reasons of state, conferred the kingdom of Judea upon Herod. Having had this unexpected success at Rome, he returned with all expedition to Judea, and in about three years' time, B. C. 37, got possession of the whole country. When Jerusalem was taken by Sosius and Herod, and by the death of Antigonus, beheaded by order of Marc Antony, at the request of Herod, the Ammonian family terminated, 126 years after Judas Maccabaeus. Herod was a perfecutor and tyrant; he began his reign with the death of many of the adherents of his rival Antigonus, and with the confiscation of their effects. He also decoyed Hyrcanus, the banished pontiff, from Parthia, that, notwithstanding his most solemn promises to the contrary, he might put him to death. His own family did not escape his cruelty. He had married Mariamme, the daughter of Hyrcanus; whose brother, Aristobulus, was made high-priest at the intercession of his mother; but the tyrant, knowing that Aristobulus had a better right to the kingdom than himself, caused him to be drowned in a bath; and then sacrificed his own wife Mariamme. Her death was soon followed by that of her mother Alexandra, and this by the execution of several other persons, who had united their endeavours with her's for securing the kingdom to the sons of the deceased queen. His contempt of the Jewish ceremonies, and introduction of a number of heathenish games, exposed him to the danger of assassination; but the conspirators, falling in their attempt, were afterwards discovered by some women, who were put to the rack, and sentenced to suffer death, together with their families. Having thus disposed the people to a revolt, he found it necessary to fortify Jerusalem with additional works, to rebuild Samaria, and to garrison several fortresses in Judea. Although the relief which he afforded to his subjects in a time of famine served in some measure to allay their hatred and animosity; yet, by relapsing into his former cruelty, their hatred of him was renewed, nor did it subside till his death. About the year B. C. 23, he began to adorn the chief cities with sumptuous buildings, and to rebuild the temple. (See JERUSALEM and TEMPLE.) But all these works were not sufficient to divert the king's attention from his usual jealousy and cruelty. Prompted by his father Sosius, and one of his sons, Antipater, he murdered his two sons by Mariamme, Alexander and Aristobulus; but his cruelty and jealousy were prematurely diffused in his attempt to destroy the Saviour of the world. At length he was feized with a lachrymose and incurable disease, which terminated in his death, very much to the joy of his subjects, Nov. 25th, B. C. 4. He had previously put Antipater to death, and divided his kingdom among his sons in the following manner: Archelaus had Judea, but his power did not extend over the whole land of Israel, and particularly not to Galilee; Antipas, or Herod, was tetrarch of Galilee and Perea, and so continued till he was removed by Caligula, the successor of Tiberius (see HYROD-AntIPAS); and Philip had the regions of Trachonitis, Gaulonitis, Batania, and Panias, which he erected likewise into a tetrarchy, and governed 37 years, till his death in the 20th year of Tiberius. For other particulars relating to Herod the Great; see his article. The death of Herod was followed by insurrections and tumults. Archelaus was opposed by his brethren, and obliged to appear at Rome before Augustus, with whom many complaints were lodged against him. (See ARCHELAUS.) Upon the banishment of Archelaus, A. D. 6 or 7, Judea was reduced to a Roman province, and put under the government of Roman officers sent from Rome; and appointed to be a branch of the province of Syria. But in order to keep this country of Judea in good order, there was an officer, with the title of procurator, sent by Augustus, to reside and govern there, invested with the supreme authority, or, as Lardner says, the power of life and death. The first of these was Coponius, the next Marcus Ambivius, his successor Annus Rufus, in whole time Augustus died, A. D. 14. The next was Valerius Gratus, who was appointed procurator by Tiberius, and continued in the province 11 years; and was then succeeded by Pontius Pilate, who governed Judea during a period of ten years, which expired some time before the parabol, A. D. 36. After the removal of Pilate, for about four or five years at the most, it may be questioned, whether the Jews had now any procurator residing among them with the power of life and death, as they had from the year of our Lord 7, to the year 36 or 37. But however this be, it is certain that they were subject to the Romans. For when the Samaritans, with whom the Jews are supposed to have joined, waited upon Vitellius, the president of Syria, interreating that Pilate might be removed, they made very solemn proffessions of their willingness to continue under the Roman government, and only complained of the tyranny of Pilate. Dr. Lardner is of opinion, however, that they had no procurator residing among them from the time of Pilate's removal to Agrippa's ascension to the kingdom of Judea, in the reign of Claudius. In considering the circumstances of the Jews in their own country at this time, as it is described by the writers of the New Testament, and other ancient authors, we may regard both their religious and civil state. That they had, according to the sacred writers, the free exercise of their religion, is evident from the whole tenor of the history contained in the Gospels and the Acts of the Apostles. They had their synagogues, in which the law and the prophets were read; and
in which our Saviour taught. In the whole history of our Saviour's ministry there is no mention of any restraint, or obstruction which they met with in their worship, except that which occurs in Luke, xiii. 1. It appears also probable that they were at liberty to perform all their religious services, if we consider, that the Romans always permitted the people conquered by them to practise their own religious rites in their own way; nor do we seem to have departed from this principle till after the period of the evangelical history. Josephus also affirms us of this fact. The Roman governors did, indeed, sometimes offer abuses, or suffer abuses to be committed in the country, contrary to the institutions of the law; and they also injured them with respect to their civil property. But these abuses do not seem to have been very numerous; when any were committed, it was without the emperor's authority; and, usually, the Jews at length obtained satisfaction. In considering the civil state of the Jews, Dr. Lardner distributes their history into four periods; viz. the first, which reaches from the preaching of John the Baptist to our Saviour's resurrection; the second, from thence to the time of Herod, the king, mentioned Acts, xiv.; the third, the reign of this Herod; and the fourth, from the end of this reign to the conclusion of the evangelical history. In the investigation of this subject, the conclusions resulting from it, learned men have entertained different opinions; particularly with regard to the extent of the power and authority possessed by the Jews, and with respect to the question, whether they had the power of life and death, or only a right to inflict some lesser penalties. This enquiry should be restricted to the state of the Jews in Judea, properly so called; and therefore it does not comprehend the beheading of John the Baptist, which was perpetrated by Herod, tetrarch of Galilee, son of Herod the Great; who, without doubt, had the power of life and death, however he abused it, in his own territories. With reference to the first period, we are assured by all the evangelists, that our Saviour was brought before Pilate, governor in Judea, during the whole time of our Saviour's ministry, and condemned by him; and he was crucified by Pilate's officers; and yet the Jews are more than once said to have crucified Christ, because his death was owing to their perfecution and iniquity. Nor is it uncommon to ascribe to men not those things which they themselves do, but those which are brought about by their means. For the particular illustration of this subject, we must refer to Lardner's Works, vol. i. ed. 8vo. After adducing and examining, with his usual accuracy and impartiality, the main passages of this period, concerning the power which the Jews possessed in their own country, he concludes with the following summary. They practised their own religious rites, worshipped at the temple, and in their synagogues, followed their own customs, and lived very much according to their own laws. They had their high priests, council or senate; inflicted lesser punishments; they could apprehend men, and bring them before the council; and if a guard of soldiers was needful, could be assisted by them, upon asking the governor for them; they could bind men and keep them in custody; the council could summon witnesses, take examinations, and when they had any capital offenders, carry them before the governor. This governor usually paid a regard to what they offered; and, if they brought evidence of the fact, pronounced sentence according to their laws. But he was the proper judge in all capital causes; for when the council of the Jews had before them a case, which they pretended to be of this kind, having prepared it, they went with it immediately to the governor, who re-examined it, and pronounced the sentence. Our learned author has examined and maturely considered the various occurrences of the three subsequent periods, and satisfactorily shewn, that whatever power the laws exercised with regard to the infliction of lesser penalties, and however tumultuously and illegally they might have acted in particular cases, they had no power of life and death. The arguments deduced from the facts related by the evangelical historians are further confirmed by the testimony of ancient writers. Ulpian, a famous Roman lawyer, expressly says, "The magistrates of municipal places (see Municipal Cities) may not punish a slave with death; but the inflicting lesser penalties is not to be denied them." This single authority is sufficient to decide the question. The Jews lived according to their own laws, as municipal people did; but then, if these laws, who were Roman citizens, had not the right of punishing a slave with death, certainly the Jews had not, whilst under the Roman government.

Soon after Pilate's deposition, Caius Caligula promoted his old friend Agrippa to the regal dignity; but he did not long enjoy this honour. (See AGRIPP.) On his death, A.D. 44, Judea was made a Roman province by Claudius, who sent Cyprian Flavius the tetrarch as governor; he was succeeded by Tiberius Alexander, an apostate Jew ofFacial race, and nephew to the famous Philo. The subsequent history of ancient writers. Ulpian, a famous Roman lawyer, expressly says, "The magistrates of municipal places (see Municipal Cities) may not punish a slave with death; but the inflicting lesser penalties is not to be denied them." This single authority is sufficient to decide the question. The Jews lived according to their own laws, as municipal people did; but then, if these laws, who were Roman citizens, had not the right of punishing a slave with death, certainly the Jews had not, whilst under the Roman government.

Soon after Pilate's deposition, Caius Caligula promoted his old friend Agrippa to the regal dignity; but he did not long enjoy this honour. (See AGRIPP.) The ground, after having put all the Romans to the sword. At length Cælius Gallus was routed; and having marched into Judea with a powerful army, burned all the towns and villages in his way, massacred all the Jews he could find, and purified those that escaped and that were in arms, almost as far as Jerusalem. The Jews were thrown into such confusion, that they abandoned all the outer quarters of the city, and retired into the inner citadel near the temple. Cælius set fire to the former, and resolving to besiege the latter, took up his head-quarters in the royal palace. Instead of putting on the siege, it was shamefully railed by the advice of some generals of Cælius, whom Florus had corrupted; so that the insurgents, recovering their spirits, pursued him to Gideon, and defeated him with great slaughter. The Jews now deliberated concerning the best means of carrying on the war against the Romans, and appointed some of their bravest chiefs to command the several cantons and fortresses of Judea. Josephus, the writer of these wars, was appointed governor of the two Galilees; Joseph, the son of Gorion, and the high-priest Ananus, had the government of Jerusalem; and to Eleazar, the chief of the revolters, was assigned that of Idumea. In the mean while there reigned such discord among the Jews, that many of the better sort, foreseeing the bad effects of the repentment of the Romans, forsook the city. The Christians retired into Pella, the city on the other side of Jordan, in the tetrarchy of Herod, whither the war did not reach. When Nero received advice of the state of affairs in Judea, he nominated Vespasian, who had signalized himself in Germany and Britain, to march with all speed against Judea with a powerful army. He accordingly repaired to Syria, where he collected all his forces and those of his auxiliaries, while his son Titus was sent to fetch the fifth and tenth legions from Alexandria to Judea. Before their arrival, 10,000 of the Jews, who besieged Ascalon, were killed by Antony; and on a second attempt their loss was doubled. In the beginning of the year 68, Vespasian, joined by Titus, entered Galilee, with a force of 63,000 well-disciplined men; and having burnt Gadara, advanced to besiege Jotapata. Josephus, governor of that province, having previously supplicated the place with every persuader, defended it with great bravery 47 days; but it was at length taken by assault, and the garrison were put to the sword. All the Jews were murdered or made prisoners. Forty thousand are said to have been slain, and Josephus was among the prisoners. As soon as the news of the capture of Jotapata reached Jerusalem, the Jews, who heard that Josephus was among the slain, made great lamentations for the loss of him for a whole month; but when they were informed that he had surrendered himself a prisoner to the Romans, they began to consider him as a base betrayer of their country; and to persecute him with the most irreconcilable hatred and disdain. The Romans pursued their conquests; and after the reduction of Tarichea and Tiberias, all the other cities of Galilee submitted to the Romans, except Gischala and Gamala, and the mountain of Ithabur. These places were at length taken with great loss to the Jews; and the reduction of Gischala having completed the conquest of Galilee, Titus rejoined his father at Cæsarea, where their troops had some repulse before they undertook the siege of Jerusalem. At this time the Jewish nation was divided into two very opposite parties; one, which wished to submit to the Romans, and another, sprung from the Gaulonitic incendiary, called the Zealots, which breathed nothing but war, confusion, and cruelty. This latter party committed the most horrid acts of plunder and massacre; and took possession of Jerusalem. After having butchered all persons of any distinction or character, they began to wreak their rage on the common people who opposed them. This savage despotism obliged many of the Jews to forsake Jerusalem and take shelter under the Romans, though they did it at the hazard of their lives, the gates and avenues of the city being so closely guarded that it was extremely dangerous to retire, and many who were caught in the attempt were immediately put to death. Vespasian remained at Cæsarea an inactive spectator of the dismal condition of the Jewish nation. At length the Zealots themselves divided into two factions; the most profligate of them joined John of Gischala, and others opposed him. During thisarchy, there arose in the country a new gang of Sicarii, who, having seized the strong fortresses of Mafada, arranged themselves under a bold adventurer, called Simon, and made this their place of retreat. These plundered, burned, and massacred everywhere, and carried their booty into that place. Nero, about this time, A.D. 68, put an end to his life at Rome: and Vespasian was busily employed in making preparations for the siege of Jerusalem. In the mean while Simon, at the head of a great army, committed hostilities against the Zealots; and having successfully invaded Idumea, posted his army at the gates of Jerusalem. Simon without, and John within, vied with each other in their crimes and cruelties. At length Simon was, by an act of treachery, admitted into the city, where he laboured to make his authority absolute. While Judea was thus feverishly distracted with foreign and internal wars, the Roman empire was in a state of great confusion. But as soon as Vespasian was chosen emperor, A.D. 69, he restored a calm to the empire. Josephus, who had previously apprised him of his advancement to the throne, began to reap the benefits of his anticipation. The emperor, recollecting his predictions, recomposed his fidelity with many signal favours. As soon as Vespasian received intelligence that his caution was confirmed at Rome, he left the belt of his troops with his son Titus, with orders to besiege Jerusalem and to destroy it utterly; and then he prepared for returning to the capital of his empire. The Jewish divisions in the mean while increased. Three factions subsisted in Jerusalem, which were incessantly contending with and weakening each other; till at length Titus, with four legions under his command, marched against the city in different directions. On his approach, the perfidious who composed the three factions, seeing that they were besieged by so powerful an army, under a brave general, thought it necessary to unite in a vigorous defence against the common enemy. It was not long, however, before their union was dissolved; and one faction being destroyed, Simon and John sometimes made united fallies against the besiegers, and at other times turned their arms against one another, as if they had pledged themselves to make their ruin more easy to the Romans. The proofs of the siege we shall not here minutely describe; some notice has already been taken of it under the article Jerusalem; and for a fuller account we refer to Josephus (Bell. Jud. lib. vi. cap. 7.). The siege commenced in April, and lasted till the 8th of September, A.D. 70, when the city was taken and entered by Titus. According to Josephus, the number of prisoners amounted to 97,000, besides about 11,000, who were either flaved through neglect, or flaved themselves through self-mutilation and despair. Suetonius and Cornelius Nepos reckon but 600,000 slain and prisoners in the course of this war; but they lived at a distance, and were left competent to give a just estimate of the number than Josephus, who was a party and an eye-witness; though he is thought to have exaggerated in compliment to Titus and the Romans. From the computation of Julius Lipsius, on the authority of Josephus, the whole number of
of the Jews that perished in the several places through the kingdom, and elsewhere, from the beginning to the conclusion of the war, amounts to 1,554,470 persons. Besides these, a vast multitude died in the caves, woods, wildernesses, common forests, in banishment, and in many other ways, of whom no computation could be made; 10,000 were slain at Totapa, not admitted into the author's computation. Allow-
ing for the prisoners and others that have been omitted, the whole amount will be above one million four hundred and sixty thousand. Simon and John, the two grand rebels and leaders of the principal factions, were referred for the tri-
umph of Titus. These two infamous persons appeared at the head of 700 of the most beautiful Jewish captives who adorned this triumph. Simon was dragged through the streets of Rome with a rope about his neck, severely scourged, and put to death with some of his associates; but John was sent into perpetual imprisonment. The last fortresses that was attacked and taken was Maffada, the besieged, under Ekaazar, the grandson of Judas the Gaulonite, having agreed to destroy another; and thus this dreadful war terminated. Vespasion ordered the Jewish lands to be sold for his own use; and all the Jews within the Roman empire were commanded to pay into his treasury the usual tribute of half a shekel, or two drachmas, which they had formerly been obliged to pay for the use of the sanctuary. His like-
wife caused all the branches of the house of Judah to be cut off, to deprive them at once of all hopes of a deliverance, or future Messiah. Thus ended the Jewish nation and wor-
ship; nor have they been able to regain any settlement in their native country of Judea; but there is scarcely a country, on the face of the globe where they are not to be found. They still remain, as a monument of the truth of our religion, a distinct people, unincorporated among the inhabitants of the countries in which they reside. They still profess to pay a regard to the worship and ceremonies enjoined by the law of Moses, to which they have added many rites that are merely of traditional authority. They also entertain the unfounded expectation of a Messiah to deliver them from the low state into which they are sunk. In many countries, and in different ages, they have been most cruelly massacred, and it is lamentable to think that they have been generally more mildly treated by Pagans and Mahometans than by Christians. It would be endless to recite the numerous edicts that have been framed against them, and it would be painful to recount the instances of severe perfecution which their history furnishes. And yet, notwithstanding all the con-
tempt and insult, and suffering which they have endured, they are still suffixed in almost every part of the globe. There are few countries from which they have not been repeatedly banished, though they have availed themselves of the opportuni-
ties for returning, which change of circumstances has afforded them; and many of them have acquired both wealth and reputation, notwithstanding the opprobrium which they have endured. There is hardly any country in Europe in which the Jews have enjoyed greater liberty than in Holland. Here they have had their stately synagogues and academies; and their house of judgment, or court of judicature, was en-
dowed with singular authority, being allowed to judge of criminal as well as civil cases. Poland has been looked upon as a nursery of learned rabbins, and the country to which the Jews have been formerly accustomed to send all their youths to study the Talmud, and the rites of their religion. The city of Hamburg has been called the "Leiter Jeru-
salem," an account of the many Jews that live and trade in it. The Jews have been endowed with great privileges at Prague. In Hungary they had in the 17th century the privilege of farming the revenue; till an edict of Ferdi-
inand II. deprived them of it in 1640. Here they held their grand council, A.D. 1659, in which was debated the grand point, whether the Messiah was come? (See Appendix.) In Holland they are paid by one of their writers to have enjoyed greater liberty and quietness, and have been more flourishing and wealthy than in any other part of the world. We find nothing worth mentioning concerning the Jews in Eng-
lund till the time of king John; except that they were invited into this kingdom by William the Conqueror. Even so early as the reign of King Stephen, A.D. 1145, they were accused of crucifying a young Christian in contempt of Christ and his religion, and were accordingly punished for it; they were again prosecuted for the same atrocious fact at Gloucester, in the reign of Henry II. A.D. 1162; and for a third, committed at St. Edmundbury, A.D. 1181; but these tales were probably false accusations alleged against them as apologies for oppressing and plundering them. The exactions imposed by king John, A.D. 1215, fell with peculiar weight on the Jews, whom he cauffed to be imprisoned and tortured, because they refused to pay the taxes which he imposed upon them. At length he con-
cluded all their effects and banished them by a public edict. They were not treated in a much better manner under the long reign of Henry III., when many of them chose to become Christians, in order to avoid the severity of his go-

government; but being afterwards detected, they were pun-
ished for their dissimulation. The Jews of Norwich, A.D. 1235, were accused of having stolen a Christian child, and of having kept him a whole year, in order to circumcise and crucify him on the ensuing passover; but the fact being detected, they underwent a due punishment. Some other similar facts have been mentioned, which at this distance of time, and considering the various means that were used for raising money, cannot be duly authenticated. The Holy war, to which Henry was preludingly invited by the pope, A.D. 1252, proved another pretence for squeezing money out of his subjects, and especially from the Jews, whom he made no scruple to strip of all they had left. Another caufe of demand was the Spanish war. After their expul-
sion by king Edward, A.D. 1291, they never more ap-
peared in a body in this kingdom from that time, till they were recalled to it in the time of Oliver Cromwell. Rabbi Menasse, it is said, came over into England A.D. 1656, with a design of procuring a settlement for the Jews, and was well received by Cromwell and the parliament; as was also his apology for the Jews, in which he exploded all the calumnies raised against his nation, especially those of their crucifying and using the blood of Christian children at their passover; he is said to have pleaded his cause so well, as to ob-
tain a better settlement and greater privileges for them than they had before enjoyed in England.

Formerly in this country, as it is said, the life of a Jew was at the dispofal of the chief lord where he lived, and also all his goods. So strong were the popular prejudices against them, that in the year 1348 a fatal endemic diemper, which raged in a great part of Europe, was ascribed to their having poisoned the springs and wells; in confluence of which, a million and a half of them were cruelly massa-
cred. In 1492, half a million of them were driven out of Spain, and 150,000 from Portugal. But we rejoice to think that we live in a more enlightened period, when a more liberal system is established. The countries of Europe, we trust, are beginning to perceive the wisdom and benefits of universal toleration. In England the Jews are allowed the free exercise of their religion, liberty of trade, and the quiet enjoyment of their property, though some accession to their freedom is still wanting. (See Jew's Bill.) Here, like
JEZ

like those of Holland, they are commonly distinguished into German and Portuguese, and have their respective synagogues, chief schools, &c. but no academy; so that they are obliged to fend their youth to be educated in Germany, or to Portugal. The former are the most indigent, as well as the most zealous for their religion, and most careful to instruct their children in it, and in the kénain of the Hebrew tongue; whereas the latter, being opulent, are more remiss in these respects; inasmuch that many of them cannot so much as understand the liturgy of their synagogues, but have it translated into Portuguese. However, both of them have had some learned rabbis. The rich among them are very generous and charitable, not only to their own poor, but to those of the Christians. Attempts are now (1811) making for communicating instruction to their poor, and for converting them to Christianity. In France they have lately obtained a very considerable extension and establishment of their privileges; an act of political wisdom which in due time will, without doubt, be imitated by other states; so that Jews will not only be merely tolerated in other countries, which is now the case in several countries of the sort, but obtain a permanent settlement. Anc. Univ. Hist. vol. ii and iii. Mod. Univ. Hist. vol. xi.

JEWS, are those who profess obedience to the laws and religion of Mosis. See JUDMIS.

By flat. Ann. c. 30. if Jewish parents refuse to allow their Protestant children a fitting maintenance, suitable to the fortune of the parent, the lord chancellor, on complaint, may make such an order as he shall fee proper.

JEZDIKAN, or JEDZKAN, in Geography, a town of Persia, and Aridbezian; 90 miles W. of Tabris.

JEZKDAST, or YEDKAS, a town of Persia, in Farishtan; 43 miles S. of Ifpahan.

JEZIDES, or Jezideans, a term used among the Mottomans, to signify heretics.

In which sense Jezidan stands opposed to Muffulman. Leunclavius tells us, that the name is derived from an emir, called Jezid, who killed the two sons of Ali, Hafan and Hulfeen, two grandsons of Moshen on their mother's side, and percutted the potterly of the prophet. The Agarenians, whose emir or prince he was, looked on him as an impious and heretical person, and hence took occasion to call all whom they accounted heretics, Jezideans.

Beaufobre conjectures, that the denomination of this sect is derived from the name of Jefus; but it seems rather to be borrowed from the Perian Jezid or Jezidan, signifying the good God, in opposition to Arimarius, the evil principle; by which the term points out this sect as the worshippers of the good or true god. After all, this name may have been derived from the city Jezid.

Some authors mention the Jezides as a particular people, speaking a language different both from the Turkifh and Perifian, though somewhat akin to the laft. They farther tell us, that there are two kinds of Jezides; the one black, the other white. The white have no fit in the bofon of their firt, but barely an opening for the head to pass through; a thing that they obferve with a great deal of strictnefs, in memory of a circle of gold and light, which they say fell from heaven upon the neck of their grand fheif, or chief of their fel. The black Jezides are faquirs, or religious, and go arrayed in fable garments.

The Turks and Jezides bear a strong aversion to each other, and the greateft affront one can put upon a Turk, is to call him a Jezidean. On the contrary, the Jezides love the Christians, being persuaded that Jezid, their chief, is Jefus Chrift; or rather, because some of their traditions mention, that Jezid made an alliance with the Chriftians against the Muffulmen.

They drink wine, even to excess, when they can get it, and eat swine's flesh. They never undergo circumcifion, excepting when they are forced to it by the Turks. Their ignorance is surprising; they have no books. Indeed they prefer to believe in the Gospel, and in the sacred books of the Jews; but they never read either one or other of them. They make vows, and go on pilgrimage; but have no mosques, temples, nor oratories, no feaf, nor ceremonies; all their religious worship consisting in singing hymns to Jefus Chrift, the Virgin, Mofes, and Mahomet. When they pray, they look towards the caft, in imitation of the Chriftians; whereas the Muffulmen turn towards the south. They believe the devil may possibly, one day, come into favour again with God; and that he is the executor of God's justice in the other world; for which reason, they make it a point of prudence not to speak ill of him, lest he should revenge himself of them.

The black Jezides are reputed faquirs: and it is forbidden to wear at their death; instead whereof they make rejoicings: and yet, for the generality, they are no more than shepherds. They are not allowed to kill the animals they eat; that office belongs to the white Jezides. The Jezides go in companies like the Arabs; and are an unfettled, wandering tribe, who frequent the Gordan mountains, and the deserts of Cerdilla, a province of Persia. They often change their habitations, and live in black tents made of goats' hair, and encompassed with large ruffles and thorns interwoven. They dipose their tents in a circle, placing their flocks in the middle. The buy their wives; the flated price whereof is two hundred crowns, be they better or worse. They are allowed divorce, provided it be to become faquirs. It is a crime among them to flare their beard, though ever fo little. They have some customs which intimize that they sprung originally out of some fect of Chriftians; for inculce, in their feafs one of them pretends a cup full of wine to another, bidding him take the cup of the blood of Jefus Chrift; which laft kills the hand of him who pretends it, and drinks.

JEZIERNICA, in Geography, a town of Lithuania, in the patinate of Novogrode; 40 miles S.W. of Novogrode.

JEZIOROCZE, a town of Lithuania, in the patinate of Wilna; 32 miles W.N.W. of Braflaw.

JEZORA, a town of Lithuania, in the patinate of Troki; 12 miles N.E. of Grodno.

JEZREEL, in Scripture Geography. See ESDREAELON.

If, in Geography, a small, fortified, and garrisoned illand in the Mediterranean, near the coast of France, at the entrance of the port of Marseilles.

IPFEBAN, a town of Perian Armenia; 138 miles E.N.E. of Erivan.

IPFROS, a town of Arabia, in the province of Yemen; 12 miles E.S.E. of Tafs.

IFLAMABAT, a town of Hindooftan, in the country of Bengal; 124 miles S.S.E. of Dacca.

IFRAN, or Ufaram, a town and district of Africa, near the Atlantic, belonging to Morocco; 40 miles S.W. of Non.

IPVER KYLEE, a town of Sweden, in the province of Tavalland; 26 miles N.N.E. of Jamiro.

IQA, a sea-port town of Japan, in the island of Nipon, and to the W. of Owari; 85 miles S.E. of Meaco. N. lat. 33° 39' 10", E. long. 138.

IGARIFE, a river of Brazil, which runs into the Paraguay.
IGALSHA. one of the smaller Shetland islands, near the W. coast of Mainland. N. lat. 63° 57'. W. long. 1° 48'.

IGAT, a small island in the East Indian sea. S. lat. 7° 11'. E. long. 120° 35'.

IGEIALIN, a small island in the strait between Russia and America. N. lat. 65° 30'. E. long. 189° 36'.

IGGON, a small island on the W. side of the gulf of Bothnia. N. lat. 60° 43'. E. long. 17° 7'.

IGILGILI, in Ancient Geography, a town of the eastern part of Mauritania Cæsariensis, situated near the promontory which forms the bay of Saldae, to the east. It has been episcopal. See Jisiel.

IGILLUM, now Giglio, an island of Italy, in the vicinity of that of Diamuro, towards Etruria. The thick woods of this island served as a place of refuge for a great number of Romans, who fled from the sack of Rome by Alaric.

IGLAU, in Geography, a town of Moravia, capital of a circle of the same name, which contains 21 towns, 254 villages, and 6433 houses. The town is well built, fortified, and populous; and contains 1195 houses, two convents, and a village. The cloth manufactured in this town is good, and is conveyed to Italy by Trieste. The town has also considerable commerce in corn and hemp; 62 miles S.E. of Prague. N. lat. 49° 25'; E. long. 15° 32'.—Allô, a river of Moravia, which runs into the Teva near Muechau.

IGLORSOIT, a town of East Greenland. N. lat. 61° 25'. W. long. 45° 10'.

IGNATEVSKOE, a town of Russia, in the government of Ekaterinofther; 40 miles S. of Bachmut.

Gen. Ch. Cal. Perianth inferior, of one leaf, short, bell-shaped, with five upright, ovate, blunt teeth. Cor. of one petal, funnel-shaped; tube thread-shaped, a spath long, smooth, erect; limb flat, in five deep, oblong, obtuse, entire segments. Stam. Filaments five, inserted into the receptacle, as long as the tube, thread-shaped, very smooth; anthers cohering in the form of an oblong, acute, hispid, five-fied tube. Pét. German minute, inferior, ovate, smooth; style thread-shaped, the length of the filaments; stigma in two deep oval-sided divisions. Peric. Berry large, pear-shaped, smooth, of one cell, with a thick woody coat. Seeds numerous, smooth, crowded, hard, oblong, somewhat angular; the plumea flaked.

Eff. Ch. Calyx inferior, five-toothed. Corolla with a very long tube. Berry coated, of one cell, with many seeds.

1. I. amara. Linn. Suppl. 149. (Ignatiana Philippina; Lour. Cocheire. 136.)—Native of the East Indies.—A cree, with long, twining, copious, smooth branches. Leaves opposite, flaked, ovate, entire, a spath long, very smooth. Petals axillary, small. Flowers very long, drooping, white, scented like jasmine. Fruit the size and shape of a middling pear. Seeds scarcely an inch long, very bitter, celebrated as a cure for weaknesses in the stomach, and for intermitting fevers.

Julliff refers this plant to the genus Strophanthus, but Gartner points out the flaked cotelixons (or plumula), as almost peculiar to it, and not found in that genus.

IGNATIUS, in Biography, one of the apostolical fathers, was bishop of Antioch, in Syria, towards the latter part of the first and the beginning of the second century. According to Eusebius and St. Jerome, he succeeded Eudius in the see of Eunodius, having been ordained, says the former, in the year 69, after the death of Peter and Paul at Rome, or, as others say, by Peter; and hence we may conclude, that he was acquainted with severall of the apostles. Indeed, St. Chrysofollus says, that he conversed familiarly with them, and was perfectly acquainted with their doctrine. This venerable man was condemned, in the perfection of Trajan, to be devoured by wild beasts in the public theatre at Rome, whither he was brought from Syria by the emperor's order for this purpose. The time of his martyrdom has been placed by Eusebius, and after him by Dupin, Tilllemont, Cave, and Lardner, in the 10th year of Trajan, A. D. 107; but by Pearson, Loyd, Pagi, Le Clerc, and Fabricius, in 116; the former, however, is thought to be the most probable opinion concerning the time of his death. Eusebius and Jerome mention seven epistles written by this father, and besides these, other epistles have been ascribed to him which are universally supposed by learned men to be spurious. Of the above-mentioned seven, there are two editions; one called the larger, and oftentimes the interpolated; and another, called the smaller. It is now, says Lardner, the general opinion of learned men, that the larger are interpolated, and that the smaller have by far the better title to the name of Ignatius. The larger, says this judicious writer, who compared the two editions, are an interpolation of the smaller, and not the smaller an epitome or abridgment of the larger. But whether the smaller themselves are the genuine writings of Ignatius, bishop of Antioch, is a question that has been much disputed among the ablest critics. Upon duly considering the testimonies alleged from Irenæus, Origen, and Eusebius, and also the internal characters of simplicity and piety, which occur in these epistles, (viz. the smaller,) Dr Lardner concludes it to be probable, that they are for the main the genuine epistles of Ignatius. As to the time in which they were written, this is determined by that of his martyrdom. For they were written after he was condemned to the wild beasts, and whilst he was conducted as a prisoner from Antioch to Rome. These epistles are now extant in Greek, and in an ancient Latin version, which latter was published by archbishop Ufher in 1663. In 1646, Haëe Vullans published fix of the seven epistles in Greek, from a MS. at Florence; the epistle to the Romans, which was wanting, has been since published in Greek by Rutnart, from a MS. at Paris. In Ignatius's epistles there are frequent allusions and references to particular books, or texts, of the New Testament; and it has been observed by some learned men, that this ancient writer has made mention of the epistles of the New Testament under some general names and divisions. Lardner's Works, vol. ii.

Ignatius is said by Socrates, the ecclesiastical historian, lib. vi, cap. 8. "to have established antiphonal finging at Antioch, from a vilion, in which he saw the blessed spirits above finging hymus to the sacred Trinity, alternately; which method of finging," says the same author, "Ignatius taught to the church; and this, together with the account of the miracle which gave rise to it, was communicated to all the churches of the East."

Nicerophon, St. Chrysofollus, Anathasius, and many others, acquiesce in this account of the origin of antiphonal finging, as do our countrymen Hooker, Hammond, Beveridge, and Dr. Comber.

IGNATIUS LORYLA. See JESUITS.
IGNATIUS's Bean, Faba Sanit Ignatii, in the Materia Medica, the fruit of a plant growing in the East Indies and Philippine islands, described by Father Camili, in the Philosophical Transactions, under the name of Cataloegnys, and Cantantana, and by Plukert, under that of Cucurbitifera malabathri folis scantans, curta et fruticosa, fruit unincupati. The Spaniards call it cathaginos. It is a dry and hard fruit, or kernel of a fruit, of the size of a large hazel nut; and is much celebrated for its medicinal virtues, being recommended in vertigo, lethargies, epilepsy, lumbas, quartan agues, and worms. It is also given against diftemperatures of the stomatch, and as an alexipharmic. The dofe in substance, as an emetic, is ten or twelve grains; and in smaller doses it sometimes promotes a plentiful sweat; Neumann says that he has known intermitting fevers cured, by drinking, on the approach of a paroxysm, an infusion of some grains of the seed in carduus water; and Dr. Lewis has been informed, that two grains were found to have as much effect as a full dofe of bark. But it seems too hazardous for general use. See Nux Vomica, St rhythm, and Ignatia.

IGNAVUS, in Natural History, a name given to the animal called in English the sloth. See Bradypus and Sphota.

IGNARIUS LAPS, a name given by some to the pyrites, or fire-stone, from its yielding a great quantity of sparks when struck against steel.

IGNICOLA, Wonders of Fire. See Garres.

IGNIS AQUA, Fire-Water, a name by which Helmont, in some of his writings, calls the alkaline, or universal diffolvent, so much talked of by him and Paracelsus.

IGNIS FUSSUS, a common meteor, chiefly seen in dark nights frequenting meadows, marches, and other moist places, and often seen in burning grounds, and near dunghills. It is known among the people by the appellations Will with a Whip, and Jack with a Lantern.

Sir Isaac Newton calls it a vapour shining without heat; and it has been supposed to be of the same nature with the light issuing from putrescent substances. Willughby and Ray were of opinion that it is occasioned by shining insects: but all the appearances of it observed by Dr. Derham, Becarria, and others, sufficiently evince, that it must be an ignited vapour. The form and size of the ignes fatui are very various and often variable. The late experiments on air serve to furnish a rational explication of this phenomenon, to which the ignorant and superstitious have ascribed so many alarming purpoifes. Inflammable air has been found to be the most common of all the fictitious airs in nature; and to be the usual product of the putrefaction and decomposition of vegetable substances in water: and Sigismund Volta, in a letter to Dr. Priestley, informs him that he has seen inflammable air by the electric spark, even when the electricity is very moderate: and he supposes, that this experiment explains the inflammability of the ignes fatui; provided they consit of inflammable air issuing from marshy ground by the help of the electricity of fogs, and by falling stars, which are very probably thought to have an electrical origin. (Priestley's Obs. on Air, vol. iii. Appendix, p. 383.) The reader will find a particular account of various particulars relating to the ignis fatuus, in the Phil. Trans. Abr. vol. vii. p. 147, &c.

Dr. Shaw describes an ignis fatuus, which he saw in the Holy Land, that was sometimes globular, or in the form of the flame of a candle; and immediately afterwards spread itself so much as to involve the whole company in a pale inoffensive light, and then contracted itself again, and suddenly disappear. But in less than a minute it would become visible as before; or, running along from one place to another, with a swift progressive motion, would expand itself, at certain intervals, over more than two or three acres of the adjacent mountains. The atmosphere at this time had been thick and hazy, and the dew on their bridles was usally clammy and unctuous. In the same weather, he observed those luminous appearances, which, at sea, skip about the masts and yards of ships, and which the sailors call corpse-fumes, by a corruption of the Spanish cuerpo santo. Shaw's Travels, p. 392.

IGNIS GRENENUS, in Chemistry, a name given by Paracelsus to a certain menstruum, capable of dissolving all bodies, and remaining itself unaltered by them.

Van Helmont seems to make this the same with the alkalies, so celebrated in his writings, and so ardently fought after by all the chemists since his time.

IGNIS JUDICII. See Judicium Dii, and Ordeal.

IGNIS SCHEL, literally holy fire, in Medicine, an appellation which has been given, from ancient times, to various diseases, of which external redness and heat, followed by ulceration or gangrene, seem to have been the principal characteries.

Other apppellations have been used as nearly synonymous with this; such as ignis sanitatis, hum St. Anthony's fire, mercurius, or mal des ardents, &c. By different writers, however, these terms have been applied to diseases of considerable difference of characters, by which much confusion has been produced. We have already stated that the word facer, or incendus, was employed to denote any thing great; and was used as an epithet to diseases of uncommon severity and duration, which, as Arceus observes, seem to require more than human power to cure them (see Epilepsi,) and were often considered as indications of the divine vengeance. The name of St. Anthony seems to have been first associated with an epidemic and fatal disease, which prevailed in many parts of Europe, and especially in Dauphine, about the end of the 12th century, when the religious houses of the order of St. Anthony were used as hospitals for those who were attacked with the disease. (Mezeray, Abregé Chronologique.) It was the popular opinion in France, in the 12th and 13th centuries, that all the patients, who were conveyed to the abbey of St. Anthony, which had been recently founded at Vienne, in the province full mentioned, where the bones of this saint had been deposited, were cured in the space of seven or nine days. It is stated (in the Histoire des Ordres Monastiques, tom. i. p. 337,) that in 1702, there were three fome black and withered limbs which had been preferred in that abbey from the period allowed to the St. Anthony's disease: and it appears from a memoir by M. Le Comte, physician to the abbey at Vienne, that the same disease prevailed in Dauphine in 1709. This physician affirms that the disease might be cured by judicious medical treatment; but that the most certain relief was obtained by addressing a vow to St. Anthony. See a full and able history of the subject in the Mémoires de la Société Royale de Médecine de Paris, tom. i. p. 260. by M. M. de Jullien, Paulet, Saillant, and the abbe Teisser, who were nominated by the society to investigate it.

From this circumstance, it would appear that the erythema, which consists of an inflammation of the skin, accompanied by the rising of large blisters, analogous to those produced by the action of fire, whether in burning or calcining, has obtained in this country the appellation of St. Anthony's Fire. It is not, however, the disease above alluded to as formerly epidemic in France.

The Latins understood by the term ignis facer the erythemas of the Greeks, as well as the zona, or Alpes Alpinae, which
which we call *flangleas*. See Celsus, De Med. lib. v. cap. 28, who places the disease among the *noli ulcera*, and mentions two species, one of which is apparently the *zeber*. — Alfo, Marcellus, de Medicamentis, cap. xx. — Plin. Nat. Hist. lib. xxxvi. cap. 2. See Hanger.

It is probable that the complaint among modern writers above mentioned, has arisen from the application of the terms *ignis facer*, *feu facer*, feu St. Antoine, and mal des ardens, to three varieties of disease, essentially different from each other, exclusive of the erysipelas: these are the common plague, the dry gangrene, or *ergot*, and the *rapprophia*. The two first, it appears, were prevalent about the same periods, in the tenth, eleventh, and twelfth centuries, affecting chiefly the lower classes of the people; whence historians have confounded the symptoms of the two maladies. But from the investigation of M. M. Janvier, it is obvious that the disease, more particularly designated by the title of "mal des ardens," was an acute pellonial fever, attended with extreme heat, and with buboes in the groin, *i.e*., the *pyis inflammaris* or *inflammata*, of Dr. Saillant, *pyis qui prendit en flaire,* which was also called the "plague" described by Ambrose Paré, Boccaccio, Guy de Chauliac, Vinarius, &c. in the 14th century. This was likewise the opinion of Allcruc. But the second, *ignis facer*, or feu St. Antoine, was, in fact, a chronic disease, of considerable duration, accompanied by severe pain, and terming at a shrivelling and drying of one or more of the limbs, which became black, and ultimately dropped off, if the life of the patient survived.

In the *mal des ardens*, or plague, no drying or dropping off of the limbs occurred; and in the *feu facer* no inguinal buboes, or acute fever. In short, the latter was obviously the disease which was subsequently designated *ergot*, and has been attributed, by the majority of writers on the subject, to the use of rye as a meal, which was affected with the disease so named, to which that grain is liable. (See Encyclopaedia Medicinalis.)

"Notwithstanding what has been maintained by the majority of authors, as stated in the article just referred to, it seems probable that this disease, which has been also called the *dry gangrene*, originated rather from a state of starvation, or improper nutriment, than from the *ergot* rye in particular. "For it occurred only after unfavourable seasons, when death prevailed, and was augmented by wars; and it afflicted almost exclusively the labouring people, the peasantry, and mendicants;* who," as M. Gaffoul observes, "in order to avoid actual famine, were compelled to live upon a sort of bread made of the meal of acorns, of grape-stones, of the roots of fern, and other such crude and unwholesome substances." Camerarius positively affirms, that this gangrene was observed in the extremities of persons who had certainly not eaten any ergot rye. (See Acad. Natur. Curiosi. Cent. iv. Obs. 82.) "It was probably to these dry and contracted limbs that the term *febrile* was applied by Pliny and Galen, as well as to those which occur in the last stages of scurvy, rather than to the spasmodic contractions in St. Vitus's dance, or *Chorea St. Vitii*, to which they have since been applied. (See Chorea.) These contractions occurred among the Roman soldiers in Germany, and were attributed to the use of water from a particular spring (see Pliny Nat. Hist. lib. xxv. c. 3); but more probably originated from imperfect nutriment.

A third disease, which has been several times epidemic in Germany and Sweden, and seems to differ materially both from the common plague and from the dry gangrene, has been attributed by some to the *ergot* of rye, and confounded, under the title of *ignis facer*, and *ergot*, with the dry gangrene. This is a febrile disease, which is said to begin with an acute heat, accompanied with a sense of *formication*, or of the creeping of insects over the skin, which is followed by acute pains in the limbs, and convulsive contractions of the muscles. This disease is said to affect in successive paroxysms, after several of which it terminates by a violent death, or diarhoea. If continued long, it degenerates into epilepsy or palsy. The sweating sickness of England, and the morbus Hungaricus, seem to have partaken of the nature of this fever; and to have originated, like it, in the use of corrupted and imperfect aliment, when every unfavourable feason produced a famine. Many writers, however, were persuaded that it originated from the *ergot* of rye; while others attributed it to the husk and husk "uliginalis," with which the corn and herbs were affected. The malady was epidemic in Sweden in 1746 and 1754, when it was observed that the *rapphatus raphaniferum* grew in great abundance among barley; and Linnaeus, supposing this to be the cause of the disease, fed some fowls with the seeds, which were said to be freed from convulsions; whence he gave the name of *Raphania* to the disease, which was adopted by Dr. Cullen. (Lin. Amoenit. Acad. vol. v. Cullen Nofol. Method. Gen. ii.) It was called *Morus convulsum* epidemiam by the Marpurg profecors, and from the sense of formation, was popularly termed, in Germany, *die krökel kranksheit*. (See Gregor. Horst. Opera, tom. ii. lib. viii. Obs. 22. Cullen Nofol. with the numerous references there given; and particularly the paper of M. Saillant, in the Mem. de la Soc. Roy. de Med. tom. i. p. 303; likewise the genera of Echampia, sp. 1. *typodes* and Convulfo, sp. 8 *uliginalis*, in the Nomenclature of Sauvages.) It may, perhaps, be again questioned, however, whether, in these experiments of Linnaeus, and in those of the abbé Tellier before mentioned (see *Ergot*), the animals fed with the seeds of the raphaniferum and ergot rye were not rather flared, for want of nutritious food, than poisoned by that which was deleterious. Is it probable that the rye, through extensive provinces, should be all affected with the ergot; so as to produce a general epidemic? Is not the disappearance of the disease in our own times rather to be attributed to the general improvements in agriculture, which have rendered death less frequent and extensive, and to the increase of commerce, which has facilitated the supplies of nutritious food, to make up for these partial deficiencies, than to the disappearance of the diseases of corn? See *Raphania*.

IGNIS, St. Antoni. See *Erysipelas*.

IGNISPIClUM, among the Romans, a species of divination taken from the fire used in sacrifices. See Pyromancy.

IGNITION, in Chemistry, the application of fire to metals, till such time as they become red-hot without melting. This happens in gold and silver, but especially in iron; but lead and tin are too soft and fusible to bear ignition.

IGNORAMUS, q. d. *We do not know*; in Law, a word used by the grand jury, impannelled on the inquisition of causes criminal, and formerly written upon the bill, when they dislike their evidence, as defective, or too weak to make good the presentment. But now they assert in English, more absolutely, "not a true bill," or, which is the better way, "not found."

The effect of which is, that all farther inquiry upon that party for that fault is thereby stopped, and he is delivered without further answer. See *Bill vera*.

IGNORANCE, the privation, or want of knowledge. Ignorance, according to Mr. Locke, is chiefly owing to three causes: want of ideas; want of a discernible connection between the ideas we have; and want of tracing and examining our ideas. See *Idea*.

There
There are some things we are ignorant of for want of ideas: all the simple ideas we have are confined to the observation of our senses, and the operations of our own minds, which we are conscious of in ourselves. What other ideas it is possible other creatures may have, by the affillence of other senses or faculties, more or less perfect than we have, or different from our’s, is not for us to determine: but to say there are no such, because we conceive nothing of them, is no better an argument, than if a blind man should be positive there was no such thing as light and colours, because he had no manner of idea of any such thing.—What faculties, therefore, other species of creatures have, to penetrate into the nature and immut constitutions of things, we know not; this we know, and certainly find, that we want other views of them, besides those we have, to make discoveries of them more perfect. The intellectual and sensible worlds are in this perfectly alike; that the parts which we fee of either of them, hold no proportion with that we see not; and whatsoever we can reach with our eyes, or our thoughts, of either of them, is but a point, almost nothing, in comparison of the rest. Again, the want of ideas, which we yet seem capable of, is another great obstacle in our way, and keeps us in ignorance of things, which we conceive capable of being known. Bulk, figure, and motion, we have ideas of; yet, not knowing what is the particular bulk, motion, and figure, of the greatest part of the bodies of the universe, we are ignorant of the several powers, efficacies, and ways of operation, whereby the effects we daily see are produced. These are hid from us in some things, by being too remote; and in others by being too minute.

This, at first sight, shews us how disproportionate our knowledge is to the whole extent even of material beings: to which if we add the consideration of that infinite number of spirits that may be, and probably are, which are yet more remote from our knowledge, and whereof we have no cognizance at all; we shall find this caufe of ignorance conceals from us, in an impenetrable obscurity, almost the whole intellectual world; a greater, certainly a more beautiful world than the material: for, shewing some very few ideas of spirits, which we get from our own mind by reflexion, and from thence the belief we can collect of the Father of all spirits, the author of them, and us, and all things; and, if we have no certain information so much as of the existence of other spirits, but by revelation; much less have we distinct ideas of their different natures, states, powers, and several constitutions, wherein they agree or differ one from another, and from us: and therefore, in what concerns their different species and properties, we are under an absolute ignorance.

Another caufe of ignorance is, the want of discoverable connexion between those ideas we have: where we want that, we are utterly incapable of universal and certain knowledge; and are, as in the former case, left only to observation and experiment. Thus the mechanical affections of bodies having no affinity at all with the ideas they produce in us, we can have no distinct knowledge of such operations beyond our experience; and can reason nothing of them, than as the effects or appointments of an infinitely wise agent, which perfectly surpaus our comprehension. The operation of our minds upon our bodies is as inconceivable: how any thought should produce a motion in body, is as remote from the nature of our ideas, as how any body should produce any thought in the mind. That it is so, if experience did not convince us, the consideration of the things themselves would never be able, in the least, to discover to us. In some of our ideas there are certain relations, habits, and connections, so visibly included in the nature of the ideas themselves, that we cannot conceive them separable from them by any power whatsoever: in these only we are capable of certain and universal knowledge. Thus the idea of a right-lined triangle necessarily carries with it an equality of its angles to two right ones; but the coherence and continuity of the parts of matter, the production of sensation in us, of colours and sounds, &c. by impulse and motion, being such wherein we can discover no natural connection with any ideas we have, we cannot but ascribe them to the arbitrary will and good pleasure of the wise architect. The things that we observe constantly to proceed regularly, we may conclude, do act by a law set them; though by a law we know not, whereby those causes work steadily, and effects constantly flow from them, yet their connections and dependencies being not discoverable in our ideas, we can have but an experimental knowledge of them. Several effects come every day within the notice of our senses, of which we have so far sensitive knowledge; but the causes, manner, and certainty of their production, we must, for the foregoing reasons, be content to be ignorant of. In these we can go no farther than particular experience informs us of matter of fact; and, by analogy, we guess what effects the like bodies are, upon other trials, likely to produce. But as to perfect science and natural bodies (not to mention spiritual beings), we are so far from being capable of any such thing, that it may be reckoned lost labour to seek after it.

The third caufe of ignorance is, our want of tracing those ideas we have, or may have; and finding out those intermediate ideas, which may shew us what habitude of agreement or disagreement they may have one with another: and thus many are ignorant of mathematical truths for want of application in inquiring, examining, and by due ways comparing, those ideas.

IGNORANCE, in Law, is a want of knowledge of the laws; which will not excuse a person from suffering the penalty annexed to the breach of them; because every one is obliged, at his peril, to know the laws of the land. "Ignorantia juris, quod quique tenetur seire, neminem excusat," is as well the maxim of our own law, as it was of the Roman. (Plowd. 345. Ff. 22. 6. 9.) The ignorance or mistake which constitutes a defect of will, is, when a man intends to do a lawful act, but does that which is unlawful. For here the deed and the will acting separately, there is not that conjunction between them which is necessary to form a criminal act. But this must be an ignorance or mistake of fact, and not an error in point of law. Or if a man, intending to kill a thief or housebreaker in his own house, by mistake kills one of his own family, this is no criminal action (Cro. Car. 538.); but if a man thinks he has a right to kill a perfam excommunicated, or outlawed, wherever he meets him, and does so; this is wilful murder according to the principle above stated.

IGNOROUS, in Geology, is a term used by Mr. Kirwan (Geolog. Essays, p. 161. 27. 4., &c.) to denote the substances thrown out of volcanos; and in which also he includes the materials of pseudo-volcanic tracts, or those which have been exposed to accidental fires, like the burning of a seam of coals, &c.

IGRANI, in Geography, a town of European Turkey, in Dalmatia; 44 miles E.S.E. of Mollara.

IGRIDI, a town of Atalactic Turkey, in Caramania, situated on a large lake.

IGUALADA, a town of Spain, in Catalonia; 18 miles S.E. of Cervera.

IGUANA, in Zoology, the name of a species of lizard, very frequent in the West Indies. It is an amphibious animal,
mal, of the lizard shape, and in colour partly brown and partly grey, in some of the animals; and in others of a
beautiful green, variegated with black and white spots.
From its neck to the extremity of its tail, it has a continued
series of flat-pointed and serrated scales, of a fine green
colour. These are largest at the neck. See LACERTA.
IGUAPE, in Geography, a river of Brazil, which runs
into the Atlantic, S. lat. 3° 35'. W. long. 38° 56'.
IGUAY, a river of South America, which rises in Para-
guay, and crossing Brazil, runs into the Atlantic, forming
a large estuary at its mouth, where it is called " Rio
Grande." S. lat. 31° 54'.
IGUEN, a river of Brazil, which runs into the Atlantic,
S. lat. 1° 20'.
IGUIDI, a town and district of Africa, in the country of
Sahara; the country is also called " Lempta."
IGUINAS, a small island in the bay of Panama. N. lat.
7° 40'. W. long. 81° 8'.
IGUIRA, a town of Africa, on the Gold Coast, in the
country of Sago, near which is dug very fine gold.
IGUITPO, a town of Brazil, in the government of St.
Paul.
IGUNSKOI, a town of Russia, near the eastern extrem-
ity of the continent of Asia. N. lat. 65° 45'. E. long.
188° 40'.
IGUVIUM, now Geneva, in Ancient Geography, a town
of Italy, in Umbria, situated towards the S.W. among
the mountains. It was municipal, and at some distance from it
was a temple of the Apennine Jupiter.
JHANSU-JEUNG, in Geography, a town, castle, and
valley of Thibet. The town, if it may be so called, confis-
t of a monastery, situated on the concave side of a steep rock,
and of about 150 houses, which rife in rows, one behind the
other. They are square, pretty regular in their form, and
the whitened walls have a band about their tops, two or
three feet broad, of a deep garnet colour, which, with the
addition of temples, gilded ornaments, and the decorated
dwellings of their superior priests, make a very handsome
and brilliant facade. The whole building was surrounded
by high walls, which were continued along the ridge of the
rock, and crossed by many intermediate gateways or lodges-
ments, so as to command the monastery, which fronted to-
wards the castle, as well as to overlook the other side of the
rock, which is extremely rugged, and almost perpendicular.
The vicinity abounds with beggars of all ages and of both
sexes. The cattle lands upon a rock, which, from its per-
pendicular height, and the irregularity of its cliffs, and not
impregnable, must at least be extremely difficult to be sub-
dued by the assaults of any Tartar enemy. The valley of
Jhansu, which is very extensive, has greatly the appearance
of having been once the bed of a lake. It is particularly
famous for the manufacture of woollen cloth, for which there is
a very great demand. These cloth, which are confined to
two colours, garnet and white, seldom exceed half a yard
in breadth; they are woven very thick and close, like our
frieze; they are very soft to the touch, for the fleece of their
sheep appears to be remarkably fine, and supplies an ex-
cellent material. Its superior pliability and warmth induce
almost all the priests, both here and in Buddhist, to use it
for the short veil which they wear next the skin; and those who can afford it have also their winter mantle of the
same. For this manufacture, the valley of Jhansu, from its
central position, is very conveniently situated, both as to
receiving the material and conveying the cloth, when manu-
factured, to Tshoo Loomboo, Laffa, and Buddhist. It has,
in consequence, become the principal settlement of manu-
facturers; and it certainly pollutes ever natural and essen-
tial advantage of space, climate, and fertility. It is extremely
rich with abundant crops of corn, and exceedingly populous;
130 miles W.S.W of Laffa. N. lat. 28° 49'. E. long.
89° 32'. Turner's Thibet, p. 227.
IHLE, a river of Brandenburg, which, by the addition
of an artificial canal, forms a communication between the
Havel, 9 miles W. of Brandenburg, and the Elbe.
IHNE, a river, which rises from a lake in the New
Mark of Brandenburg, passes by Stargard, Gohonw, &c.
and runs into the Dammisch fce or Oder, 9 miles below
Dammmue.
JHONSEN, Robert, in Biography, an ecclesiastic, and a
learned musician, was one of the first of our church com-
posers who disposed his several parts with intelligence and
design. In writing upon a plain-long moving in flow notes
of equal value, which was so much practised in those times,
he discovers considerable art and ingenuity in the manner
of treating subjects of fugue and imitation; in which kind of
writing he seems to have been much superior to To-
nerer.
JURE, John, public professor of rhetoric and politics in
the university of Upsal, was born in March 1707. He was,
on account of the early death of his father, chiefly educated
under his grandfather, then archbishop of Upsal. In 1730,
when he had completed his studies, he set out on his travels
to enlarge his literary acquisitions, and improve himself by
the company and conversation of learned men. In 1733 he
returned to Upsal, where he published "De Usu Accen-
tuum Hibernorum," and was elected a member of the Academ-
y of Sciences. In 1737 he was made public professor of
poetry, and in 1748 he was appointed by the king professor
of rhetoric and politics; an office, the duties of which he
discharged for 40 years with great reputation, and with
much real benefit to his pupils. In the year 1756 king
Adolphus Frederick raised him to the rank of a counsellor
of the chancery; two years after to that of privy council; and
in 1759 conferred on him the order of the Polar Star. He
died in 1780 in the 74th year of his age. He was author of
many works, which will be lasting monuments of his great
learning and indefatigable industry. In the year 1736 he
undertook a Sueco-Gothic Lexicon, and began to arrange
the materials which he had been preparing for the purpose.
In 1766 he published a "Lexicon Dialectorum," in which
he explained and illustrated obsolete words, till used in the
provinces; and in 1750 his "Glossarium Sueco-Gothicum"
was published in two volumes folio. Sweden is indebted to
him for many other works, particularly for an explanation
of the old catalogue of the Sueco-Gothic kings, to which
are added the Old West-Gothic Laws. In his dissertations
"De Rumanor Antiquitate, Patria, Origine, et Occafu"
he attests that the Runic writing was formerly used in the
greatest part of Europe, was introduced into Sweden about
the sixth century, and became entirely extinct in the be-
igning of the 15th. He was possessed of a sound judgment
and a retentive memory; and so clearly were his ideas ar-
anged, that he had never any need to correct what he had
composed. He was of a mild disposition, loved innocent
mirth, had an open friendly heart, and entertained the utmost
reverence for the Supreme Being.
JHYLUM, in Geography, a town of Hindooistan, in
Lahore, 73 miles N.N.W. of Lahore.
JHYLUM RIVER. See BEHUT.
JIB, in a Ship, is the fore-most fall of it, being a large
stay-fall extended from the outer end of the bow-sprit, pro-
longed by the jib-boom, towards the fore-top-mast head.
Jib-Boom is a boom run out from the extremity of the
bow-sprit, parallel to its length, and serving to extend
the
bottom of the jib, and the flap of the fore-top-gallant-mast. It is attached to the bowsprit by means of two large boom-irons, or by one boom-iron, a cap on the outer end of the bowsprit; or by the cap without, and a strong haliing within.

JIBBEL-Aures, in Geography. See Aures.

JIBBEL-Deca, a mountain of Algiers, in the province of Titterie; 50 miles S. S.E. of Algiers.

JIBBEL-Karkar, a range of rocky mountains in the western province of Algiers; 20 miles N.E. of Tlemcen.

JIBBEL-Doue, a mountain of Africa, in the western province of Algiers; S. of El Khadarah.

JIBBEL-Jelil, a mountain of Africa, in the northern part of Tunis, anciently mount Cerna; about 15 miles S.W. of Bizerta.

JIBBEL-Muellenbold, a mountain of Algiers, in the province of Constantina, the chief abode of a clan of Kabyles, called Welled-Abendon; 45 miles S. of Constantina.

JIBBEL-Celilo, a mountain of Africa, in the Sahara; 78 miles S. S.E. of Algiers.

JIB-Beleah, a range of mountains of Africa, forming a boundary between Tunis and Tripoli.

JIBING. See YING.

JIDDA, in Geography, a sea-port town of Arabia Felix, in the sherriffate of Mecca, situated on the Red sea, and flrt surrounded with walls by Sultan El Guri in 1514, in order to protect it from the Portuguese, who were then beginning to become formidable on the Red sea. Although the walls are still standing, and also the bridges, they are now in a ruinous state. The palace of the Pacha is but an indifferent building; but there are other fine buildings in the town, constructed of coral stone. The other houses are flight wooden fabrics. As Jidda is entirely destitute of water, the inhabitants are supplied with that which is collected by the Arabs in reservoirs among the hills, and brought by them from thence upon camels. The drets of perfoms of distinction resembles that of the Turks in Cairo; but the poorer fort wear only a shirt without breeches. The drets of the women is that of the Arabinian females in general; large drawers, a flowing skirt, and a veil. The employment of many of the poorer fort is fishing, from which they earn but a scanty subsistance. The country round Jidda is sandy and barren, and the sea fees to have receded from the land here as well as in other places, as, at a certain distance from the shore there are hills composed of coral-rock, resembling the banks of coral lying along the coast. The Arabs have a singular method of taking wild ducks in the harbour; the person who is in search of the game tripping himself, and covering his head with sea-weeds, and thus approaching the ducks, which, unalarmed at the sight of the weeds, he feizes by the feet. As Jidda is part of the dominions of the sherriff of Mecca, the Turkish sultan lends a Pacha to this city; but the supreme authority is shared between the sherriff and the Turkish governor, who is annually changed. The revenue arising from the customs is divided between the sultan and the sherriff. The dues of custom are fixed at 10 per cent. upon the value of the goods, arbitrarily estimated, so that they may be really considered as equal to 12 or 15 per cent. The English, however, are particularly favoured, even more than the subjects of the sultan; they pay only eight per cent, and are suffered to discharge this in goods, whereas all others must produce money. Although the trade of Jidfa is considerable, this city is no more than a mart between Egypt and India. The ships from Suez seldom proceed farther than this port; and those from India are not suffered to advance to Suez. The circumjacent country affords nothing but Taif almonds for objects of traffic; and of these the English carry 500,000 weight annually to India. Bahr of Mecca is also brought hither from the neighbourhood of Medina, as an article for exportation. The imports are greater, because both Mecca and Medina are to be supplied from this market. Large quantities of corn, rice, lentils, fugar, oil, &c. are imported from Egypt, without which this part of Arabia could not possibly be inhabited. All goods from Europe come also by way of Egypt; and, on the other hand, those which are brought hither from India, pass generally into Egypt. No money is coined in this province; the specie current here is altogether foreign, and the same as at Constan- tinople and Cairo. But the larger coins pass at a higher rate here than at Cairo, because small money, brought by the pilgrims, is more plentiful here than even where it is coined. The trading janizaries in this place are properly merchants, who are protected by the privileges of that body in which they are enrolled from the impostions to which this traffic would otherwise be liable; but they perform no military duty, and receive no pay. N. lat. 21° 17'. Niebuhr.

JIDER, a river of Hindooftan, probably the same with the Selima, which runs on the west of Sirhind to the south, towards Usoom, about 60 miles S.W. of Sirhind; between which and the Setlegue a canal was formed by Ferofe.

JIDMEELAH, a town of Algiers; 28 miles W. S.W. of Constantina.

JIDDOON, a district of Afa, situated on the E. side of the river Sindé, on the borders of Cashmire and Thibet.

JIG, in Mufic, implies both a dance and a tune, generally in rapid triplets of $\frac{2}{4}$, or $\frac{3}{4}$. See GIGA.

JIGAT, or JUGGAT Point, in Geography, a cape of Hindooftan, forming the western extremity and fifth division of Guzerat, on which point is a pagoda. N. lat. 22° 23'. E. long. 68° 12'.

JIGGER, in Sea Language, is a machine consisting of a piece of rope about five feet long, with a block at one end, and a sheave at the other; used to hold on the cable, when it is heaved into the ship by the revolution of the windlass. See HOLDING on.

Jigger-tackle, is a light small tackle, consisting of a double and fingle block, used on various occasions by seamen.

JIGGUROON, in Geography, a town of Hindooftan, in the cercar of Sirhind; 23 miles W. S.W. of Sirhind.

JIGNI, a town of Hindooftan, in the cercar of Gohud; 18 miles S.S.E. of Kouch.

JIG-PIN, in Mining, is a pin of wood, which the drawers of ore or coals, &c. by rowes or turn-beams, put into a hole, to prevent the handlcs turning round, when it is wished to suspend the barrel or core in or over the shaft.

JIHON, in Geography. See AMU and OXES.

JIJEL, a town of Algiers, in the province of Constantina, now reduced to a few houfes and a small fort, in which the Turks have a small garrison: it is situated on a point of land near the sea; 35 miles E.N.E. of Boulejeh. This was formerly called Iqiqils, which fee. N. lat. 36° 56'. E. long. 6° 5'.

JIJEL-OUN, a town of Aftic Turkey, in the province of Caramania; 28 miles E. of Akferai.

JILLIFREE, a town of Africa, in the kingdom of Barra, on the banks of the Gambia. N. lat. 18° 16'. W. long. 16° 7'.

JIMMALI, a town of Abyssinia; 40 miles S. of Miné.

JIMMEL,
IK

JIMMEL, a town of Africa, in the kingdom of Tunis, anciently called 4 Tegaza; 11 miles S.W. of Lempta.—JIP, a town of Algiers, 35 miles S.W. of Constanțina.

JIMMELAH, a town of Africa, anciently "Genuella," near which are magnificent ruins, with the remains of an amphitheatre, &c.; 27 miles S.S.W. of Constanțina.

JINBALA, or GUNBALA, a kingdom of Africa, being an island formed by two branches of the Niger, which separate at leaving the lake Dibbie, and again unite about 15 miles from Tombuctoo. It is of an oval form, about 80 miles long, and about 40 in its greatest breadth. The country is said to be fertile, and abounding so much with swamps and creeks, that the Moors have not been able to subdue it. The inhabitants are negroes. Its capital is Jinbala, situated on one branch of the Niger, and serving as a resting place for merchants, who trade between Tombuctoo and the western parts of Africa. N. lat. 16° 4'. E. long. 0° 16'.

JINCUGHI, a town of Asiatic Turkey, in Natolia; 18 miles N. of Kintaja.

JINDEYA, a town of Africa, in the country of Woolly; 30 miles W.S.W. of Medina.

JINGLER, a town of Hindoostan, in Oude; 33 miles S.E. of Goracpour.

JINNETT, a sea-port town of Algiers, in the province of Titterie. Situated on a small creek of the Mediterranean, at the mouth of the Yiller. Great quantities of corn are annually exported from this part to Europe; 33 miles E. of Algiers. N. lat. 36° 43'. E. long. 4° 10'.

JINZIO, a town of Spain, in Galicia; 12 miles S.E. of Orcade.

JINZOWARAH, a town of Hindoostan, in the country of Guzrat; 40 miles S. of Janagar.

JIO, a town of Sweden, in the government of Ulea; 20 miles N. of Ulea.—JIP, a town of Japan, in the island of Xicoco. N. lat. 34°. E. long. 134° 10'.

JIPONPOUR, a circar of Hindoostan, in Allahabad, about 50 miles long and 30 broad.—JIP, the capital, which is a small city on the Goonty river; about 40 miles N.W. of Benares, and on the road from that city to Fyzabad. N. lat. 25° 46'. E. long. 82° 55'.

JIOSORRA, a town of Africa, in Bambarra. N. lat. 14° 38'. E. long. 3° 46'.

JIRBAN, a town of Arabia, in Yemen; 8 miles N.W. of Sana.

JIRREE, a town of Hindoostan, in the circar of Go- hud; 23 miles W. of Narwa.

JIRWARY, a town of Hindoostan, in the circar of Gohud; 7 miles S.W. of Gwalior.

JITTIS, a town of Sweden, in the province of Tavallh- land; 62 miles E. of Tavallhus.

JIVANI, a name of the Hindoo regent, or god of fire, corresponding in many points with the Vedic western mythology. Another of his names is Parakka, which see. JIYA, in Zoology, the name of an American animal, of the otter-kind, called also carpeuchen. It is an amphibious creature, of the size of a middle-sized dog. Its head is round, and like a cat's; but its nose is somewhat pointed; its eyes are black; its ears roundish, and placed very low as in the otter; and it has a fort of beard or whiskers, composed of a few stiff hairs; the feet have all five toes, the inner one being smaller than any of the others; the hair is soft, not long, and all black, except those on the head, which are brown, and some which compose a yellowish spot under the throat. Its note is much like that of a young puppy. It feeds on fish, and other animals. Ray.

IK, in Geography, a river of Russia, which runs into the Kana.—Alfo, a river of Russia, which runs into the Sak- kara.

IKALIS, a town of Sweden, in the government of Abo; 40 miles E.N.E. of Birnaboeg.

IKARUNGA, a town of Japan, in the island of Nipho- phon; 75 miles N. of Mexico. N. lat. 36° 16'. E. long. 136°.

IKDER, a town of Asiatic Turkey, in Natolia; 30 miles S. of Satalia.

IKEIKANI, a town of Asiatic Turkey, in Natolia; 65 miles E. of Constanținoole.

IKENDA, a town of Japan, in the island of Nipho-phon; 140 miles W.N.W. of Jego.

IKENILD STREET, one of the four famous ways that the Romans made in England. See Watling-Street.

IKLERA, in Geography, a town of Hindoostan, in Katchwara; 34 miles E.N.E. of Sarnungpour.

IKOLLA, a province of Africa, in the kingdom of Angola, E. of Lomondo.

IKON, a town of Africa, on the Gold coast, where the Dutch have a factory.

IKTIMAN, a town of European Turkey, in Bulgaria; 25 miles E.S.E. of Sophia.

IKUA, a town of Japan, in the island of Ximo; 50 miles N.N.E. of Nangasaki.

ILA, Ilay, Ifia, or Illay, is one of the Hebrides, lying to the south-west of Jura, and in the county of Ar- gyll, Scotland. It extends twenty-eight miles from north to south, and eighteen from east to west. On the east side the surface is hilly, and covered with heath, but the greater part of the island is flat. The coast is rugged and rocky, but indented by numerous bays and harbours, which are safe landing-places for small vessels; and at Lochindale is a harbour for ships of considerable burthen, with a quay, oppo- site to the large village of Bowmore. There are several lakes; and the island is well watered by numerous streams and rivers, abounding with trout and salmon. In the centre of the island is a lake called Loch Finlaggan, three miles in circumference, with the islet of the same name in the middle, the ancient residence of the Macdonalds, the great lords of the isles; but the palaces and offices are now in ruins. Instead of a throne, the chief stood on a flat stone several feet square, in which there was a hollow cut to receive his feet; here he was crowned and anointed, in preference of his chieftains, by the bishop of Argyll and seven inferior priests. The throne is still preserved. The ceremony, after the new lord had collected his kindred and vassals, was truly patri- archal. Having put on his armour, helmet, and sword, he took an oath to rule as his ancestors had done; to govern as a parent would his children; his people, in return, swore that they would render him the obedience due to a parent. Anci- ently, the dominions of this potentate included Ifia, Jura, Colonfay, Mull, Arran, &c.; and the peninsula of Kintyre usually shared the fate of the isles; for we find that, in 1593, after one of the grants of the kings of Scotland, the lord of the isles, in order to bring Kintyre within the comaps of the grant, had his barge drawn under sail over the isle of Tarbert; after which, considering his power, not even the Scottish monarch was so hardy as to deny that Kintyre was an island. About the year 1586, the domi- nation of the isles consisted only of Ifia, Jura, Kintyre, and Knapdale; so reduced was it from its former extent during the reign of James III. Near Finlaggan is another little isle, called Ila-na-corle, i.e. the island of Council, where thirteen judges confluently sat to decide differences between the subjects of the Macdonalds, for which they received the eleventh part of the value of the contested property.
In the first isle were buried the wives and children of the lords of the isles: but their own bodies were deposited in the more sacred ground of Iona. Besides the cattle on the isle, these powerful lords had a house and chapel at Lagannon, on the side of Loch-in-dal; a strong cattle on a rock in the sea, at Dunnoack, at the south-east end of the isle; for, after their expulsion from the Isle of Mann, in 1364, they made this isle their place of residence; sometimes making their abode at Dairedhain in Kintyre, where the modern burgh of Campbeltown is situated. The isle was formerly divided into four parishes, Kilchonan, Kildalton, Kilibrin, and Kilbrann; but the two last are now united. The total population of the isle, as stated in the statistical reports of the three parishes in 1793, was 975. The quadrupeds, enumerated by Mr. Pennant, besides the domestic animals, are geese, otters, and hares; the latter dark-coloured, small, and bad runners. The birds are eagles, peregrine falcons, moulr-fowl, ptarmigans, and red-breasted geese. Vipers swarm in the heath; and the natives are said to cure the wound by a poultice of hemlock and henbane. In this isle several ancient divertions and superstititions are still preserved; the latter, however, are almost extinct, or only lurk among the very meanest of the people. Yet the power of fascination still retains a strong hold on their minds. The late-wakes, or funerals, were attended with sports and dramatic entertainments, composed of many parts; and the actors often changed their dresses suitable to their characters. The subject of the drama was always historical, and preferred by memory. The general language of the common people is the Gaelic; yet English is well understood, and taught in all the schools. The chief amusements are fishing and dancing; in the latter are exhibited an eave and gracelessness of motion peculiar to this isle. Ila abounds with mines of lead and copper, which are very rich, and have been long worked. There are also vast quantities of that ore iron called bog-ore, of the concrete kind, and below it large strata of vitriolic mundic. Near the veins of lead are found specimens of barytes and excellence emery. A small quantity of quicksilver has been found in the murr, and it is probable that a more attentive search would discover more of that valuable mineral. Limestone and marble are abundant; but of these the inhabitants are scarcely acquainted with the value. Pennant's Tour to the Hebrides.

Ila, in Hindo Mythology, a female who appears in several undefined or equivocal characters. Sir William Jones notices her as the daughter of the seventh Meni, or Noah (see Menl), and wife of a son of Chandra, or the Moon. She is thus one of the maternal ancestors of both the great titles of people distinguished among the Hindoes by the titles of children of the sun, Surya-vaani (see Surya-vaan), and children of the moon, Chandra-vaana; Ila's father, Meni, being of the former race, and hence furred Vaivalwata, or offspring of the sun. (See VAIVASWATA.) In another of her characters she appears to be a personification of the earth, and the wife of Meni or Noah, in another as his son; in all of which may be traced some appearance of allegory referring to the important part borne by the great reformers of our species, as parent and protector of terrestrial productions. On one occasion she incurred the displeasure of Parvati, the Juno of the Hindoo Olympus, who cursing her, caused her to become alternately one month a man and a month a woman; but by the efficacy of devotions paid to a linga (see LIXGA), the symbol of Siva, she was restored to her permanency of sex through the favour, thus propitiated, of that divinity. This fable we shall not attempt to explain. See Moor's Hindoo Pantheon, Vol. XVIII.

ILAK, or JALAK, in Geography, a town of Nubia, on the Nile, which some suppose to have been the site of the ancient Meroe. N. lat. 17° 48'. E. long. 34° 10'.

ILAMBA, or ELUANE, the name of two provinces of Africa, in the kingdom of Angola; the Upper is the more inland, and the Lower nearer the Atlantic. Both are fertile, and yield a considerable revenue to the crown of Portugal.

ILANTZINSKOI, a town of Russia, in the government of Irkutsk; 10 miles N.N.W. of Verchni or Udink.

ILAT, a small island on the east coast of the island of Bouro. S. lat. 3° 35'. E. long. 127° 33'.

ILATHERA BARK. See CLUTIA.

ILBERG, in Geography, a town of Sweden, in the province of Warmeland; six miles N.W. of Carlsstad.

ILCHESTER, properly IVELCHESTER, is an ancient borough, market-town, and parish in the hundred of Tintinhull, Somersetshire, England, and is situated on the river Ivel. Its Roman name was Icelasse, and it was one of the most eminent stations the Romans possessed in these parts. It was by them considered with a strong wall and deep ditch, which originally was filled with water from the river. Its form was an oblong square, the Foffe-road passing through it from north-east to south-west. The vestiges both of the wall and ditch are still discernible, the former being regularly composed of stone and brick-work intermingled: the ditch on the north-west side is now filled up, and become a road called Yard-lane. The Foffe-road was here paved with large flag-stones; some of which are visible in the old ford through the river near the bridge. At the time of the Norman conquest, Ivelchelter was a city of considerable note, and contained six parish churches. Various arches and immense foundations of ancient buildings lie beneath the surface of the ground; and the entire site of the old city is filled with subterraneous ruins. The present town exhibits but small indications of its former greatness. It consists of four streets but indifferently built; and has one parish church, and a meeting-hall for Dissenters. The church has a tower, fifty feet high, constructed of Roman stone. The affords for the county were fixed to be held here by a patent granted by Edward III., but they have long since been held only alternately with Wells, Taunton, and Bridgewater. The county gaol is still here. The civil government of this borough is vested in a bailiff and twelve capital burgesses, who, together with the inhabitants not receiving alms, return two members to parliament. The first return was 26 Edward 1. An hospital for the entertainment of pilgrims and poor travellers was founded, about the year 1220, by William Dacus; it was afterwards converted into a nunnery; the ruins are still extant. A weekly market on Wednesday has existed here ever since the conquest, but has greatly declined. Here are two annual fairs. Tichester is 122 miles distant from London: the return under the population act of 1801 was 14,858 houses, and 94,424 inhabitants. The celebrated philosopher Roger Bacon, justly accounted the wonder of his age, was born in this town, A. D. 1214. Collinson's History of Somersetshire, vol. iii.
ILDINSKOI, a cape of Russia, in the Pacific ocean, near the northern part of Kamtschatka. N. lat. 59 15'. E. long. 164 14'.

1. ILIUM, in Ancient Geography, a town of Spain, belonging to the Ilerciones, at some distance from the sea, N.E. of Segobriga. In Antonine's Itinerary it is marked on the route from Dertoia to Saguntum.

2. ILERAY, in Geography, one of the smaller western islands of Scotland, near the N. coast of Banbecula. N. lat. 57 30'. W. long. 7 25'.

3. ILECAONES, in Ancient Geography, a people of Spain, in the Tarraconensis, towards the mouth of the Ebro.

4. ILECTRA, or ILERDA, a town of Spain, upon the Sicoris; its situation at the Pyrenees exposed it incessantly to the horrors of war from the time when the Romans began to penetrate into Spain. Under Gallienus it was almost entirely destroyed by the Barbarians; who, migrating from Germany, ravaged the western parts of the empire.

5. ILEGETES, a people of Hither Spain. E. of the Vacones. Their principal towns were Ilerda, Bergulias, and Oca.

6. ILES, in Agriculture, a term provincially applied in some places to denote the beards or awns of different descriptions of grain, such as barley, wheat, &c. See Awns.

7. ILETERTON, in Geography, a town of Thibet, 30 miles S.W. of Chatu-chou.

8. ILEUM, in Anatomy, the third division of the small intestine. See Intestine.

18. I. vomitoria. South-sea Tea or evergreen Caffine. Alt. Hort. Kew. 1. 170. (Caffine Paragua; Mill. Dict. n. 2 fig. t. 83. f. 2. Pluk. Mant. t. 376. f. 2. Catell. Carol. 2. f. 57.) "Leaves alternate, dilated, oblong, blunted, crenate-ferrat, fratures without prickles." Native of Wilt Florida. The leaves are used for making an infusion in the manner of tea; which is accounted by the Indians very wholesome, and is almost the only physic they use in some parts. The plant is supposed to be the same with that which grows in Paraguay, where the Jesuits make a great revenue from the leaves.

This genus consists of small trees or shrubs, with alternate leaves, evergreen, toothed and thorny; and axillary many-flowered peduncls. The common holly rises from 20 to 30 feet, and sometimes more. It grows wild in many parts of Europe, in North America, Japan, Cochinchina, &c; and is found in woods and forests in many parts of England. In English it is called "Hulver" and "Holme." For its uses, see HULLE.

Ilex, in Gardening, contains plants of the hardy evergreen tree or shrubby-kinds; of which the species mostly cultivated are the common holly (I. aquifolium); the Dahoon holly (I. caffine); and the South tea, or evergreen caffeine (I. vomitoria).

There are a great many varieties of both the green-leaved and variegated sorts. Of the first the common green-leaved prickly, the smooth green-leaved, the narrow ferrated green-leaved,
ILE

leaved, the green-leaved yellow-berried, the box-leaved green, and the hedge-hog green; and of the latter the common prickly, with silver striped leaves, with gold striped leaves, with blotched leaves; the smooth with white striped leaves, with yellow striped leaves, with blotched leaves, with narrow striped leaves, the blotched yellow berried; the cream-coloured, the copper-coloured, the white-leaved, the mottled-edged, the hedge-hog silver-edged, the gold-edged hedge-hog, the white-blotched hedge-hog, the yellow-blotched hedge-hog, and the painted lady variegated.

And of the second fort there are varieties with broad leaves, and with narrow leaves, with scarcely any serratures.

Method of Cultivation.—These plants are all capable of being increased from seeds, and by the operations of budding and grafting upon proper stocks.

The seeds or berries should be sown, as soon as they are perfectly ripened, in small beds prepared for the purpose. But as they are long in germinating, it is the practice with some to deposit them, for a year before they are sown in the beds, in pots filled with earth or sand, or in a hole in the earth, in a dry situation; the first is probably the best method. The plants most readily rise in the second spring, when they should be kept well weeded and watered. After they have had two years' growth in these beds they should be removed, and planted out in nursery rows at the distance of two feet, and one apart in the rows. They should remain in these till of a proper size to be planted where they are to remain, keeping them perfectly clean, and the ground occasionally stirred about them.

The proper seasons for removing them are either the early autumn or spring; the former in dry grounds, and the latter in thofe that are of a retentive nature.

In the second fort the seeds, after being prepared as above, should be sown in pots, and plunged the second spring in a gentle hot-bed, in order to bring up the plants. They should then be kept in the pots, and have protection in the winter season till they have become of Hardy growth, when they may be turned out and planted in warm situations. They afterwards require protection in very severe winters by mats or other means.

And the third fort may be managed in the same way as the first, the young plants being gradually introduced to the open air, having only the morning sun at first. They should be kept in the pots four or five years, as they grow slowly, being well protected in the winter. They all succeed best in a dry soil.

All the varieties of the different soils are to be continued either by budding or grafting upon stocks of the first fort. The first should be performed in the latter part of summer, and the latter in the early spring, upon stocks of two years' growth. See Budding, Grafting, and Inoculating.

All the forts and varieties are highly ornamental in the clumps, borders, and other parts of pleasure-grounds, affording much variety when judiciously intermixed. The first fort frequently rises to a large tree, having a fine white hard wood useful for various purposes. The bark also affords the substance called bird-lime, which is prepared by boiling it till the green part is capable of being separated from the white, then laying it in a cool cellar for a few days, afterwards pounding it till it becomes a tough paste, washing it repeatedly, till it gets quite clear, then placing it in an earthen vessel to ferment or become fine, when it will be fit for use.

ILEX. See Hippomane and Quercus.

ILEX Aquifolium, in Natural History. The leaves of this plant were found, among others, preserved in the fill and peat-matters below the ordinary level of the tides; at Sutton, in Lincolnshire, by Dr. De Serra and Sir Joseph Banks, in 1796. Phil. Trans. 1799.

ILLIRACOMB, in Geography, is a sea-port, market-town, and parish in the hundred of Braunton and county of Devon, England. It derives considerable trade from the herring-fishery in the Bristol channel. The peculiar situation and safety of the harbour occasion many vessels to put in, when it is dangerous for them to enter the mouth of the river Taw for Barnstaple. In consequence of this circumstance, much of the port business of that place is transacted at Ilfracombe. Nature and art seem to have combined in forming the harbour, which, appearing like a natural lagoon, is almost surrounded by craggy heights, overgrown with foliage. On three sides the rocks rise in a semicircular sweep; and on the fourth a bold mass of rock stretches nearly half-way across the mouth of the bay. This rock rises almost to a point; and on the top is erected a light-house, which has the appearance of a place of worship. Along the side of this rock, to the opening of the harbour, runs an artificial pier, judiciously constructed to prevent the accumulation of sand; so that by the joint assistance of the natural barrier and this piece of masonry, ships of 250 tons burden may ride completely land-locked, and safe from the violence of the weather. An inscription, over the gate of the pier, informs us that the town was indebted for this valuable addition to its convenience and advantage, to Sir Bourchier Wray, bart. who, in the year 1760, partly rebuilt, lengthened, and enlarged this extensive barrier. Previous to the year 1711, the pier was 530 feet long, but the violence of the sea having nearly destroyed it, the parish then paid an act for repairing and enlarging it, with the harbour, &c. The town consists principally of one well-built street, extending a mile in length, from the church to the sea side. A number of good houses, chiefly for the summer accommodation of strangers, is ranged along side of the harbour. The church is a large plain structure, but not demanding any particular notice. Camden, though prebendary of this place, scarcely mentions it in his Britannia. The civil government of the town is vested in a mayor, bailiffs, and other officers. Ilfracombe is 202 miles distant from London; has a well-supplied market on Saturdays; and contained, at the time of the late return to parliament, 455 houses, and 1537 inhabitants.

Three miles east of the town is Watermouth, the seat of Joseph Davie, esq. The house is situated on an eminence, having in front an inlet of the sea, which forms a most beautiful basin, environed by rocks on the right and left. The varied character of rock, lake, and dale, constitutes a very singular and romantic scenery. Warner's Walk through the Western Counties. Malfon's Observations on the Western Counties. Beauties of England and Wales, vol. iv.

ILGISKAIA, a town of Russia, in the government of Irkutsk, at the confluence of the Ilga and Lena; 32 miles S. of Orlenga.

ILGINSKOI, a town of Russia, in the government of Irkutsk, on the Ilga; 140 miles N. of Irkutsk. N. lat. 54° 50'. E. long. 107° 14'.

ILHA GRANDE, an island in the Atlantic, near the coast of Brazil, about 15 miles long and three broad. S. lat. 23° 15'.

ILHEO, a small island in the Atlantic, near the coast of Africa. S. lat. 35° 30'.

ILHEOS, a sea-port town of Brazil, and capital of a district, called "Rios dos Ilheos," situated at the mouth of
ILI

of a river of the same name. S. lat. 15° 25'. W. long. 36° 36'.

ILI, a river of Tartary, which runs into lake Palcati; 20 miles N.W. of Harcas.

ILI A, in Anatomy, the technical term for those parts of the body, which are bounded by the upper broad portions of the oifal inomminata. It is one of the subdivisions of the abdominal cavity. See ABDOMEN.

ILIABAD, in Geography, a town of Hindoostan, in the Carnatic; four miles S.W. of Arrane.

ILIAC, in Anatomy, an epithet applied to certain organs of the body, situated in or near the ili. Thus we have the common or primary ilia arteries (iliace communes); the external and internal iliac arteries (iliaca externa et interna); veins of the same names, corresponding to thefe; the posterior iliac artery (iliaca postcror or glutaex).

ILIAC Pauflon, or Iuell, in Medicine, a term used by many modern writers to designate those forms of intestinal disfease, in which, after severe attacks of pain in the belly, the inversion of the perifaltic motions of the intestines is such, as to occasion a vomiting of feculent matter. This may happen from any great obftruction of the bowels; but chiefly occurs when either inflammation is induced, or a feeve fpasmol-edic condition takes place in fome part of the canal. The ileus, therefore, is only another term for inflammation of the bowels, or enteritis in the one cafe, and for ileus in the other. (See thofe articles.) The name was probably appropriated with a view of diftinguifhing an affection of the small intestines, or ilium (iliac), from a fimilar disorder of the large intestines, or colon, which had been termed colica; but fuch diftinclion is not eafily afcerfained; and the ileus can only be confidered as an extreme degree of colic, where inflammation has not actually fupervened. The terms mi-ferere mai, volubulis, and chordoplas, have also been used as appellations of the diffeafe. All the caufes of obftruction to the free passage of the feces along the canal of the intestines, inacquif as they commonly induce inflammation, or fpasmol-edic contraction, and invert the perifaltic motion, may produce ileus: fuch as hernia, or ruptures, intus-fuflteanion, calculi, indurated feces, &c.; and the remedies applicable to colic and enteritis retpetfively will cure the diffeafe. It is to be obferved, however, that as this complete inversion of the perifaltic motion of the canal implies the moft fevere degree of these diffeafes, it is neceffarily an alarming and dangerous fymptom whenever it appears.

ILIACOUR, in Geography, a town of Hindoostan, in the country of the Nays; 20 miles N.E. of Tellicberry.

ILIACUS INTERNS, in Anatomy; illaeque, ilio-trochan- tinien; a muscle of the lower extremity, placed in the iliac fofta, and at the upper and anterior part of the thigh, and extending from the two anterior thirds of the crifia of the ilium to the trochanter minor of the thigh-bone. It is thin and broad above, narrower and thicker below, so as to be in fome degree fan-shaped. Its anterior surface is concave above and convex below: that portion of it which is above the crural arch is covered by the peritoneum, loosely at- tached by cellular subfance, by the crurum on the right, and by the fignoid furface of the colon on the left fide of the body. The anterior crural nerve is alfo in contact with it here. Below the crural arch, the iliacus internus is covered on the outide by the fartorius, on the inide by the crural veffels and nerve, and in the middle by the f-acris lata. The posterior furface covers the iliac fofta, and is attached to the two fuperior thirds of this excavation; it covers also the anterior inferior fpine of the ilium, and is attached to its marke edge; it then covers the upper end of the reclus, and the hip-joint, to the orbicular ligament of which it is at- tached.

The internal edge is covered above by the plofas magnus: below, thofe two muscles are united into one mass. The outer edge is extended obliquely from the anterior inferior fpine of the ilium to the bafe of the little trochanter; it is covered by the fartorius, and covers a little of the triceps. The upper edge is attached to the two anterior thirds of the inner margin of the crifia of the ilium, and to the ilio-lumbar ligament. From these farts the muscle defends, growing in fuperior and narrower. Conflrued with the plofas, it paffes behind the crural arch, defends obliquely from without inwards, and is attached to the trochanter minor, and to the neighbouring part of the body of the thigh-bone.

The fliffy fibres of this muscle arife from the iliac fofia, the crifia and fpines of the bone, and terminate on the ex- ternal and polferior furface of the tendon common to it with the plofas magnus. The internal ones are the foorteft, and are nearly vertical; thofe in the middle are longer and paff obliquely from without inwards; the external are the longett and fliff more oblique. The latter accompany the tendon even to the trochanter, and fome are attached to the former below that proceeds.

The iliacus internus carries the thigh-bone forwards upon the pelvis, and rotates it fo as to twiff the limb outwards. It bends the pelvis forwards upon the thigh. It produces the firf of thofe effects in progrefion, when the limb, which had been left behind, is elevated and carried in front of the other: the second action is exhibited when the trunk of the body is carried forwards on the limb fo advanced.

ILIAD, vol. I., the name of an ancient epic poem, the firft, and fird, of thofe composed by Homer. See Epic.

The critics maintain the Iliad to be the firft, and yet the behft, poem that ever appeared in the world: A跑道e's Poeties are almost wholly taken from it; the philofopher had nothing to do but to form precepts from the poet's practife. Some authors tell us, that Homer invented not only poetry, but all other arts and sciences; and that there are the visible marks of a perfect knowledge in every one of them to be feen in the Iliad.

The word is derived from the Greek ίλιαδος, of Ηιλιος, Troy, a famous city of Asia, which the Greeks befieged for the space of ten years, and at laft deffroyed, on account of the rape of Helena, which makes the Subjeft of the work.

The poet's design in the Iliad was, to SCEW the Greeks, who were divided into feveral little ftates, how much it was their interest to preferve a harmony and good understanding among them. In order to which, he fets before their eyes the calamities that befel their ancestors from the wrath of Achilles, and his mifunderstanding with Agamennon; and the advantages that afterwards accrued to them from their union. See FAUL.

In order to form a proper judgment of the diftinguishing excellence of this poem, it is neceffary, fays Dr. Blair, (Lecfures, vol. iii.) that the reader [oul] transport his imagination almost three thousand years back in the history of mankind, and confider that he is about to perufe the moft ancient book in the world, next to the Bible. He will thus divet himself of all our modern ideas of dignity and reftinement; nor will he be led to look for the correctness and elegance of the Anglifh age. What he ought to ex- peft is a picture of the ancient world, exhibiting charac- ters and manners that poffefs a confiderable train of the favage flate. The opening of the Iliad is diftinctive of that kind of dignity, which a modern expects to find in a great
ILLIAD.

epic poem. The subject is merely the quarrel of two chieftains about a female slave. The priest of Apollo beseeches Agamemnon to restore his daughter, who, in the plunder of a city, had fallen to Agamemnon’s share of booty. Upon his refusal, Apollo, at the prayer of his priest, sends a plague into the Grecian camp. The augur, when consulted, declares that Apollo cannot be appeased without reposing the daughter of his priest. Agamemnon is enraged at the augur; professes that he likes this slave better than his wife Clytemnestra; but as it was necessary to restore her in order to save the army, he inflicts upon having Brefcis, the slave of Achilles, in her room. Achilles is enraged at this demand, reproaches him for his rapacity and inolence, and solemnly swears, that, in revenge for this treatment, he will withdraw his troops, and afford the Grecians no farther assistance against the Trojans. He accordingly withdraws. His mother, the goddess Thetis, intercedes in his stead; who, for avenging the wrong which Achilles had suffered, takes part against the Greeks, and thus plunges them into deep distress; until at length Achilles is pacified, and he and Agamemnon are reconciled. Such is the basis of the whole action of the Iliad. (See Action.) Homer no subject could have been more happily chosen than that of the Iliad; which laid the foundation of the Trojan war. So great a confederacy as the Grecian states, under one leader, and the ten years’ siege which they carried on against Troy, must have spread far abroad the renown of many military exploits, and interested all Greece in the traditions concerning the heroes who had most eminently signalized themselves. Upon these traditions Homer, who is suppos’d to have lived two or three centuries after the Trojan war, grounded his poem; and the interval of time that elapsed between the war and the period of his describing it, left him at full liberty to blend fabulous with the records of true history. The subject of his choice was only that part of the Trojan war which comprehends the quarrel between Achilles and Agamemnon, and the events resulting from that quarrel. These, though they included merely an interval of 47 days, yet occupy the most interesting and most critical period of the war. By this management he has given greater unity to what otherwise would have been an unconnected history of battles. He has also gained one hero, or principal character, viz. Achilles, who reigns throughout the work; and he has shown the pernicious effects of discord among confederated princes. The praise of high invention has in every age been justly allowed to Homer; and this invention is signally displayed in the prodigious number of incidents, of characters, divine and human, with which his poem abounds; the surprising variety with which he has diversified his battles, in the wounds and death, and little history pieces, of almost all the persons. His judgment is also no less conspicuous than his invention. His story is uniformly conducted with great art. He relies upon us gradually; his heroes appear in succession, as objects of our attention: the diversities thicken as the poem advances; and every thing is so contrived as to aggrandize Achilles, and to render him, agreeably to the intention of the poet, the capital figure. Homer, however, is principally distinguished, above all other writers, in the characteristic part. His exhibition of characters is rendered lively and spirited by his dramatic mode of writing, or by his continually recurring to dialogue and conversation. As this is the most simple and artless, it is evidently the most accurate. See a specimen of it in Gen. xlii. 7-15. To the speech of Homer, which are upon the whole characteristic and lively, we owe, in a great measure, the admirable display which he has given of human nature. Every one who reads him, becomes familiarly and intimately acquainted with his heroes. We seem to have lived among them and conversed with them. His art in painting characters is eminently displayed in those of Helen and Paris. As for his character of Achilles; see Achilles. The gods also made a great figure in the Iliad; insomuch that Homer has become the standard of poetic theology. By means of the few events of his gods, he has greatly diversified his battles; and by frequently shifting the scene from earth to heaven, the mind is agreeably relieved in the midst of so much blood and slaughter. It has, however, been objected to Homer, that his gods want dignity; but in apology for him, it should be remembered, that, according to the fables of those days, the gods are but one above the condition of men, and posses all the human passions. Nevertheless, though Homer frequently degrades his divinities, he knows how to make them appear, in some conjunctions, with the most awful majesty. Jupiter, the father of gods and men, is, for the most part, introduced with great dignity, and several of the most sublime conceptions in the Iliad are founded on the appearances of Neptune, Minerva and Apollo, on great occasions. As to Homer’s style and manner of writing, it is easy, natural, and in the highest degree animated. In his style he has the most splendor of all the great poets, and in this respect it is worth bearing in mind how much of the poetical parts of the Old Testament. Of the simplicity of his style, we can form no adequate idea in the midst of the elegance and luxuriance of the language of Mr. Pope’s translation, however excellent that translation may be deemed as a poetical performance. In the midst, however, of that plenitude of fiction for which Homer is distinguished, there are everywhere where breaking forth upon us flashes of native fire, of sublimity and beauty, which hardly any language but his own could preserve. His verification has been universally acknowledged to be uncommonly melodious; and to carry, beyond that of any poet, a resemblance in the found to the sense and meaning. In narration, continues Dr. Blair, Homer is, at all times, remarkably concise, which renders him lively and agreeable: though in some of his speeches he is tedious. He is every where descriptive, and descriptive by means of those well chosen particulars, which form the excellency of description. Virgil gives us the nod of Jupiter with great magnificence:

"Annuit; et totum nutu tremecfecit Olympum."

But Homer, in describing the same thing, gives us the fabulous eye-brows of Jupiter bent, and his ambrosial curls shaken, at the moment when he gives the nod; and thereby renders the figure more natural and lively. In drawing our attention to any interesting object, he paints it in a manner to our light. The flight of Pandarus’ arrow, which broke the truce between the two armies, as related in the 14th book, may be given for an instance, and, above all, the admirable interview of Hector with Andromache in the 6th book, where all the circumstances of conjugal and parental tenderness: the child affrighted with his father’s helmet and crest, and clinging to the nurse; Hector pulling off his helmet, taking the child into his arms, and offering up a prayer for him to the gods; Andromache receiving back the child with a flood of pleasure, and at the same instant bursting into tears, εὐπαθεῖα διπλῶς ἀπανθάμενα, as it is finely expressed in the original, form the most natural and pleasing picture that can possibly be imagined. Homer, it is observed, particularly excels in battles. In describing these, his genius is most highly displayed, insomuch that Virgil...
III. II. Lie's battles, and indeed those of most other poets, are cold and unanimated in comparison with those of Homer. No poet aboundis so much with similes. Several of these are extremely beautiful; such as those of the fires in the Trojan camp compared to the moon and stars by night; Paris going forth to battle, to the war-horse prancing to their rider; and Enthusious Eumach to the flowering shrub cut down by a sudden blast; all which are among the finest poetical passages that are any where to be found. His comparisons, however, are not reckoned among his greatest beauties, for several reasons suggested by Dr. Blair. See Lectures, vol. iii. p. 247. For the conduct of the Iliad, see father Bossu, Madam Dacier, and M. De la Motte.

The Iliad is divided into twenty-four books, which are marked with the letters of the alphabet. Pliney gives us an account of an Iliad written on to very slender a paper, that the whole might be contained in a nut-shell.

The ingenious Mr. Barnes, of Cambridge, has very strenuously attempted to prove Solomon to have been the author of the Iliad.

The English translation of the Iliad by Mr. Pope is well known. This translation, though faithful in the main to the original, and though thought by some to have accommodated the Homer so very ingeniously, is nevertheless no other than Homer modernized. There is, as Dr. Blair observes, no author to whom it is more difficult to do justice in a translation than Homer.

ILIGATANGAN, in Geography, one of the small Philippine islands, N.W. of Leyte. N. lat. 11° 24'. E. long. 124°.

ILIGNO BAY, a bay on the S.W. coast of the island of Mindanao. N. lat. 7° 30'. E. long. 120°.

II. LII OS, in Anatomy, a name given to one of the divisions of the os innominatum. See Extremities.

II. LIIA, in Geography, a town of Asiatic Turkey, in the province of Diarbekir, situated on the Euphrates; 60 miles W. of Diarbekir.

II. LIM, a river of Russia, which rises in N. lat. 54° 20', and runs into the Angara, near Samskina, N. lat. 75° 25'. E. long. 102° 3'.

II. LIMSK, a town of Russia, on the Ilim, in the government of Irkutsk, in the environs of which are found the most beautiful black fables; 152 miles N. of Irkutsk. N. lat. 56° 20'. E. long. 103° 56'.

II. LINSKA, a town of Russia, in the government of Irkutsk, on the Lena; 56 miles N. of Kirensk.

II. LINSKOH, a town of Russia, in the government of Tobolsk; 8 miles N. of Athinsk. — Also, a town of Russia, in the government of Tobolsk; 52 miles E. of Tobolsk. — Also, a town of Russia, in the government of Olotok; 8 miles N. of Olginka.

Also, a town of Russia, in the government of Nogorod, on the river Sula, opposite to Teterovetz.

II. LION, a town of Thibet; 25 miles W.N.W. of Haratoube.

II. LION, or II. LIIUM, in Ancient Geography. See Troy.

II. LIPA, ALCEPA, a town of Spain in Catalonia, N. of Hifpalis, upon the right bank of the Eutic. Strabo relates, that the environs of this town had mines of silver. Its medals bear the head of a female, supposed to be Ceris, with emblems of abundance.

II. LIPEE, in Botany. See Bassia.

II. LIPIULA, NIESLA, in Ancient Geography, a town of Spain, in Battiach, W. of Tucci. Livy calls it Lipia, but Ptolomy and M. D'Anville name it Hifpalis.

II. LIIUS, in Geography, a town of South America, in the province of Popayan; 20 miles S. of Paffo.

III. II. LIISSIDES, in Mythology, a surname of the Mufes, from the river Ilissus in Attica, the waters of which were reckoned sacred.

II. LIISSUS, in Ancient Geography, a town of Attica, called by Pliny " locus Ilissus." — Also, a small river of Attica, on the route from Athens to Cyno-Sarges, which had to the west a small river called Euboea. This river was consecrated to the Muses and other deities.

II. LITA, in Hindu Mythology, a name of Parvati, confort of Shiva; similar, perhaps, to Iliasa, which see.

II. LITYHYA, derived from sthina, to spring from, in Mythology, the daughter of Juno, and sister of Hebe, who presided over deliveries. This goddess had a temple at Rome, in which were registered the birth and death of every citizen; a custom established by Servius Tullius.

II. LIVILIHU, in Natural History, a name given by the inhabitants of the Philippine islands to a very remarkable species of birds, common in that country. It is called by some writers sturnus parula montana, the small mountain quail, and it is indeed a quail in all the characters; but it is very beautifully variegated in its colors, and is smaller than a sparrow. It lives in hilly places, and is a very well tailed bird. See Quail.

II. LIIUUM Os, Fragments of, in Surgery. See Facri-

Ture.

II. LI, I. Geography, a river of France, which rises in the department of the Upper Rhine, near Ferrette, and runs into the Rhine near Strauburg; navigable for boats from Schlettflat.

II. LIIAM, in Botany. See Callicarpa.

II. LIIAMHABAD, in Geography, a town of Hindoostan, in the circar of Mahur; 35 miles N. of Neermul.

II. LIIAHON, a town of Egypt; 12 miles S.E. of Fay-

oun.

II. LIIAMBAZAR, a town of Hindoostan, in Bengal; 25 miles S.S.E. of Nagore.

II. LILE, a town of France, in the department of the Eastern Pyrenees, on the Teck, containing about 1200 inhabitants; 12 miles W. of Perpignan.

II. LIIle, a river of France, which rises near Dingé, in the department of the Ille and Vilaine, and joins the Vilaine near Rennes.

II. LIIle and Vilaine, a department of the north-west region of France, bounded on the N. by the English channel, and the department of the Channel, on the E. by the department of the Mayenne, on the S. by the Lower Loire, and on the W. by the departments of the Morbihan and the North coast, about 60 miles in length from N. to S. and from 20 to 48 in breadth, from E. to W. It takes its name from the two rivers Ille and Vilaine, which unite together at Rennes, the capital of the department. This department contains 67,317 square leagues, and 484,685 inhabitants. It is divided into five districts, viz. St. Malo, including 101,689 inhabitants, Fougeres, 76,577; Vitre, 74,857; Redon, 66,707; Montfort, 55,971; and Rennes, 113,587. The number of cantons is 431 and of communes 332. The contributions amount to 3,214,223 fr. and the expenses charged upon it to 421,639 fr. 66 cent. This department, of a clayey soil and intermitted by gentle eminences, is indifferently fertile, and badly cultivated; producing scanty crops of grain, flax, fruits, and good pastures on the borders of the rivers. The fertile marsh of Dol is reckoned the Delta of the territory. There are considerable forests, mines of iron and lead, quarries of stone, &c.

II. LIICEBRA, in Botany. See Scabda.

I. IILECEBRUM.

2. I. fargochnorum. (Achyranthes fargochnorum; Linn. Spec. 294. Verbena rubra; Rumph. Ambh. 7. 63. f. 27. f. 2.) "Frutescent, leaves opposite, spikes compound, heaped." Pennant. Native of the East Indies.

14. I. aracn itum. Linn. Reich. (Corrigiola albella; Forlk. Defer. 207. n. 31.) "Flowers scattered, heaped, bracts flowering, equalling them, items procumbent." Found in Arabia by Forlich.

ILLEGITIMATE Birth, or Delivery, in Law. See Delivery, and Abortion.

ILLENAS, Los, in Geography, a town of the island of Hispaniola; seven miles N. of St. Domingo.

ILLESEAS, a town of Spain, in New Cathile, situated about midway in the road from Toledo to Madrid; containing two parishes and three convents; 15 miles S.S.W. of Madrid.

ILEVILABLE, in Law, a debt or duty which cannot, or ought not, to be levied.

The word nihil is usually set on a debt, or due, that is ileviable.

ILLIBERIS, in Ancient Geography, once called Helena, a town of Gaul, at the foot of the Pyrenees, upon the sea
coast towards the east; now Ehe. 

ILLICI, or Illiee, a town of Spain, in the Tarrago-

nensis, upon the gulf called "Illicitanus Sinus."

ILLICIUM, ab illliciendo, in Botany, denoting an intriguing plant, from its being very fragrant and aromatic. Linn.

Gen. Ch. Cal. Perianth fix-leafed, deciduous, the three inferior leaflets ovado; the three superior alternate ones narrower and resembling petals. Cor. Petals many (27), disposed in a triple series; the nine inferior obtuse, concave, the nine middle shorter and narrower; the inferior nine still flatter and narrower. Stam. Filaments very many (37), short, de
deped; anthers upright, oblong, obtuse, emarginate. Pdj. Germans very many (20), disposed in a circle, ending in very short spreading styles; ligmas at the upper side of the style, oblong. Peric. Capsules several (commonly eight, Lourici), ovate, compressed, hard, spreading into a circle, bivalve, (one-valved, L. opening at the upper edge, G.) Seed solitarily, ovate, rather compressed, glossy. Eff. Ch. Calyx fix-leafed. Petals 27. Capsules several, disposed in a circle, bivalve, one-seeded.

The aniseed-tree may be propagated by seeds, if they can be procured; or by laying down the young branches; or by cuttings which strike freely. It requires the same treatment as Gardenia; which see.

ILLIERS, in Geography, a town of France, in the depart-

ment of the Eure and Loire, and chief place of a canton,
in the district of Chartres; 12 miles S.W. of Chartres. The place contains 2671 inhabitants, in 9383 cantons, on 2534 kilometres and 20 communes.

ILLIMANI, a mountain of Peru, near La Paz, sup-

posed to contain immense quantities of gold.

ILLINITIONS, in Geology, is used by Mr. Kirwan (Geolog. Effays, p. 152.) to denote the divided masses of argillaceous iron ore, thought by Buffon and others, without sufficient reasom, to owe their origin to decayed vegeta-

bles.

ILLINOIS, in Geography, a lake of North America, about 20 miles long and five broad in the middle. The in-

habitants of the adjacent country are called Illinois Indians. The number of warriors is about 260. N. lat. 40° 35'. W. long. 89° 18'.

ILLINOIS, or Ilini, a river which rises from the lake Illi-

nois, and runs into the Mississippi, N. lat. 38° 40'. W. long. 92° 12'. The lands on the banks of the Illinois, particularly on the S.E. side, are perhaps as fertile as any part of N. America. They produce, in the melt luxuriant plenty, wheat, rye, Indian corn, peas, beans, flax, hemp, tobacco, hops, grapes, apples, pears, peaches, dyeing roots, medicinal plants, &c. Here also are found large forests of hickory, oak, cedar, mulberry trees, &c. Sawanas, or natural meadows, are both numerous and extensive. On the N.W. side of this river are a coal mine, half a mile in extent, and two salt ponds, 100 yards in circumference, and several feet in depth. The Illinois furnishes a communication with lake Michigan, by Chiago river, between which and the Illinois are two portages not exceeding in length four miles. The whole length of the river from the source of the Thakiki, which is at a short distance from the river St. Joseph, op-

posite to fort Joseph on the N., is 480 miles. The Indians have ceded to the United States, by the treaty of Green-

cille, in 1795, a tract of land 12 miles square, at or near the mouth of the Illinois, and also a tract 6 miles square, near the south end of Illinois lake. This lake is merely a dilatation of the river, and is situated about 240 miles below the source of the Thakiki, and 45 below the salt-ponds.

ILLISIO, in Surgery, a bruiie or contusion.

ILLITURITAE, in Law; if an illiterate man be to deal a deed, he is not bound to do it, if none be pretent to read it, if required: and reading a deed fallae will make it void. (2 Rep. 3. 11.) A man may plead non officium to a deed read falsely; as when a release of an annuity was read to an illiterate person, as a relace for the accurs only, &c. agreed to be released. (Moore, 148.) If there is a time limited for a person to read a writing; in such case illiteratua shall be no excuse; because he might provide a skilful man to intruct him; but when he is obliged to seal it upon request, &c. there shall have convenient time to be intructed. 2 Nellon's Abr. 916.

ILLITURGITI, in Geography, a town of Spain, in Andalusia, situated...
situated towards the N.E. upon the Baltic—Alfo, a town of Hispania Tarragonensis, on this side of the Ebrus.

IILOK, a town of Scavonia, situated on the Danube; 16 miles W. of Peterwaradin. N. lat. 45° 23'. E. long. 18° 8'.

ILLORA, a town of Spain, in the province of Grenada; 16 miles N. of Loja.

ILLUSIS, from alas, to turn round, in Surgery, a distortion of the eyes.

ILLUMINATION, in a general sense, denotes the act of a luminous body, or a body that emits light; sometimes, also, the state of an opaque body that receives it.

ILLUMINATION, Circle of. See Circle.

ILLUMINATIVE lunar month. See Moon.

ILLUMINATORS, artificers whose province it was, by a kind of miniature painting, to embellish books with ornamented letters and small paintings. The practice is of great antiquity.

ILLUMINATED, ILLUMINATI, a Church term, anciently applied to such persons as had received baptism.

This name was occasioned by a ceremony in the baptism of adults: which consisted in putting a lighted taper in the hand of the person baptized, as a symbol of the faith and grace he had received in the sacrament.

ILLUMINATED, ILLUMINATI, is also the name of a sect of heretics, who sprang up in Spain about the year 1575, and were called by the Spaniards, Alumbroso.

Their principal doctrines were, that, by means of a full-time manner of prayer, which they had attained to, they entered into so perfect a state, that they had no occasion for ordinances, sacraments, or good works: and that they could give way, even to the vilest actions, without sin.

The sect of the illuminated was revived in France in the year 1634, and were soon after joined by the Guerinet, or disciples of Peter Guerin, who together made but one body, called also illuminated: but they were so highly purged by Louis XIII. that they were soon destroyed.

The brothers of the Rosy Crosses are sometimes also called Illumined. See ROSCUCVIAN.

ILLUSTRIOUS, ILLUMINUS, was heretofore, in the Roman empire, a title of honour peculiar to people of a certain rank. It was first given to the most distinguished among the knights who had a right to bear the latus clavus: afterwards, those were entitled illustris who held the first rank among those called honorati; that is, the praefecti praetorii, praefecti urbis, treasurers, consular, &c.

There were, however, different degrees among the il·lustriss: as in Spain, they have grandees of the first and second classes, to Rome they had their illustres, whom they called great, major; and others left, called illustres minori.

For instance, the praefectus praetorii was a degree below the masters of the offices, though they were both illustres.

The novels of Valentine of Giigni gui as far as five kinds of illustres: among whom, the illustres administratores bear the first rank.

ILLITRIA, ILLYRICUM, or ILLYRIA, in Ancient Geography, a country of Europe, the boundaries of which have not been precisely ascertained. It was wholly contained between the rivers Naro or Narenta and Drilo. Some authors, among whom we may reckon Pliny and Ptolemy, extend the limits of this country so as to include Liburnia and Dalmatia, which see respectively. M. D'Anville has assigned to Illyricum the whole country which lies between Illyria and the small river Aris, as far as the mouth of the Driolo; but he believes, that the Illyrian nations extend much farther. The rivers of Illyricum are the Aris, forming the boundary of Italy, Oenus, Tedanias, Titinus, Naro, and Drino or Drilo. The mountains form an elevated and extensive chain, separating Illyricum from Pannonia. Part of this chain bears the name of Albias or Albas Mons, and is considered as a kind of continuation of the Carnic Alps, traverses Illyricum through its whole length from W. to E., as far as mount Scardeis in Dardania. The sea coast is covered with a number of islands. It appears from an inscription of Gruter, that Illyricum was divided by Augustus into two provinces, the Superior and Inferior; but the situation of each is left doubtful by ancient historians and geographers. According to Ptolemy, the whole of Illyricum was divided into Liburnia and Dalmatia; and it was bounded on the N. by Pannonia, part of it having Illyria on the west; on the E. by Macedonia, and on the S. by Dalmatia. In the seas that washed the coasts of Liburnia and Dalmatia there were several islands, called the Illyric islands.

ILM, or STADT-ILM, in Geography, a town of Germany, in the county of Schwartzburg Rudolstadt, on the Ilm; 14 miles S. of Erfurt. N. lat. 50° 46'. E. long. 11° 9'.

ILMAWAY, a town on the W. coast of the island of Samar. N. lat. 11° 57'. E. long. 124° 50'.

ILMEN, a lake of Russia, in the government of Novgorod, on which stands the ancient city of this name, about 48 miles long, and from 12 to 18 wide.

ILMENAU, a town of Germany in the county of Hessen, on the side of the Elbe, near which are some mines of silver and copper; 10 miles E. of Schmalkalden.

ILMINSTER, a market town and parish in the hundred of Abdiok, and county of Somerset, England. It contained, in the year 1800, 366 houses, and 2245 inhabitants. This place appears to have been some note in the time of the Saxons: for Ina, king of the West Saxons, gave the church and manor to the abbey of Michielney, in this county. To this monastery it continued annexed till the dissolution of religious houses in the time of king Henry VIII. This monarch granted it to Edward, earl of Hereford; but on this nobleman's attainder, in 1551, Illumifier reverted to the crown. It was afterwards granted to the Seymour family, and in 1795 belonged to John Hanning, esq. of Barming Court. The church is a large handsome edifice, and was made prebendal in the time of king Richard I. Among other monuments it contains, is one to the memory of Nicholas and Dorothy Wadham, the founders of a college in Oxford, bearing their name. In this church were four chantries, respectively dedicated to St. Mary, St. Catherine, the Holy Cross, and St. John the Baptist. The town consists of two principal streets, one of which extends nearly a mile in length; and the other about half a mile. In the year 1551 a fire consumed several houses here. Previous to the Norman conquest this town was privileged with a market. Near the centre of the town is a commodious market-house, or town-hall; also a long range of stables. The cloth manufacture formerly flourished here to a very great degree; and at present a considerable business prevails in the manufacture of narrow cloths. A free German school was founded here in the year 1520 by Humphrey Walrold and Henry Greenfield. Since the first endowment the revenues have been greatly increased by subsequent benefactions. This parish is divided into five titheings, and comprehends eight hamlets. The market is held on Saturdays, and an annual fair is held the last Wednesday in August. Collison's History, &c. of Somersetshire, vol. i.

ILMOLA, a town of Sweden, in the government of Vaasa; 44 miles N.E. of Christianfæt.

ILLOCCOS, a province of the island of Luzon.

ILMONTZ, a town of Sweden, in the government of Knupio; 90 miles E. of Knupio.

ILORIS, in Ancient Geography, Lorca, a town of 4 U. Hitler
Hither Spain, towards the west of Carthago Nova, called by Pliny "Monumentum Scipionis."

ILLORI, in Geography, a town of Mingrelia, on the coast of the Black sea; 14 miles S.E. of Tifgaur. N. lat. 43° 8'. E. long. 40° 42'.

ILLSTORP, a town of Sweden, in the province of Helsingland; 9 miles N. of Hudiksvall.

ILSLEY, East, or Market Illey, anciently Holdesty, or Holdeley, is a small market town in the hundred of Compton, Berkshire, England. It is 23 miles distant from London; and was returned to parliament in the year 1801, as containing 114 houses and 512 inhabitants. A weekly market is held on Wednesdays, and it has two fairs annually. But the town is principally noticed for its sheep market, which, next to that of the metropolis, is supposed to be the largest in England. It commences on Wednesday, in Easter week, and continues to be held every alternate Wednesday till Midsummer. This market of late years has become of the first importance; the annual average of sheep sold being upwards of 250,000, comprising lambs, tees, wethers, and ewes. The principal purchasers are the farmers of Herefordshire and Buckinghamshire, in which counties they are afterwards fattened for the London market. At Kates-Gore, in the parish of East Illey, were large flables, built by William, duke of Cumberland. Lysons's Magna Britannia, vol. i.

ILST, or Ylst, a town of Holland, in the department of Friesland, defended by a ditch filled with waters by the river Wymer; 12 miles N.E. of Staveren.

ILSTORP, a town of Sweden, in the west Gothland; 27 miles S.S.E. of Gothenburg.

ILTEN, a town of the principality of Luneberg; 16 miles S.S.W. of Zelle.

ILTERIB, a town of Syria, in the pachalic of Aleppo; 13 miles N.W. of Aleppo.

ILUA, in Ancient Geography, called also Ilitia, an island in the Mediterranean, on the coast of Etruria. See Elba.

ILUCHANO, in Geography, a town of Russia, in the government of Ophua; 32 miles S.S.E. of Menselinfk.

ILUCIA, in Ancient Geography, a town of Hither Spain, belonging to the Oretani.

ILU-MULU, in Botany. See Spinifex.

ILUNUM, in Ancient Geography, a town of Spain, in the Tarragonensis, belonging to the Baftitani. Ptol.

ILURBIDA, a town of Spain, in the Tarragonensis, in the country of the Carpetani. Ptol.

ILWILTZKOLSTE, in Geography, a town of Sweden, in the province of Skonen; 10 miles S. of Christianstad.

ILY, in Botany. See Arendisbomus.

ILYE, in Geography, a town of Transylvania, on the river Maros; 32 miles S.S.W. of Waffenburg.

ILZA, a town of Austrian Poland, in the pälantine of Sandomir; 14 miles S. of Rados.

IMABARI, a town of Japan, on the N. coast of the island of Shikoku. N. lat. 34° 18'. E. long. 134° 20'.

IMAGE, IMGWO, in Optics, a natural, lively representation of an object, opposed to a smooth, well-polished surface, or mirror.

The Latin word, "image," comes originally from the Greek παράστασις, imitation, to imitate, or mimic.

Image, taken more largely, denotes the specére, or appearance, of an object; whether by reflection or refraction.

In all plane mirrors, the image is of the same magnitude as the object; and appears as far behind the mirror, as the object is before it.

In convex mirrors, the image appears less than the object; and farther distant from the centre of the convexity than from the point of reflection.

Mr. Molyneux gives the following rule for finding the diameter of an image, projected in the distinct base of a convex mirror; as the distance of the object from the mirror is to the distance from the image to the glass; so is the diameter of the object to the diameter of the image. See Lens, Mirror, Reflection, and Refraction.

Image is also used for the image, or picture, which outward objects impress on the mind, by means of the organs of sense. See Idea.

Image also signifies an artificial representation performed by man; as in painting, sculpture, and the like. In which sense the word is now generally used in speaking of things holy, or imagined to be so.

The noble Romans preferred the images of their ancestors with a great deal of care and concern, and had them carried in procession at their funerals and triumphs; these were commonly made of wax, or wood; though sometimes of marble, or brass. They placed them in the vestibules of their houses; and they were to lay there, even if the house happened to be sold, it being accounted impious to displace them. Appius Claudius was the first who brought them into the temples, in the year of Rome 250, and he added inscriptions to them, giving the origin of the persons represented, and their brave and virtuous achievements.

It was not, however, allowed for all who had the images of their ancestors in their houses, to have them carried at their funerals; this was a thing only granted to such as had honourably discharged themselves of their offices: for those who failed in this respect forfeited that privilege; and in case they had been guilty of any great crime, their images were broken to pieces.

The Jews absolutely condemn all images, and do not so much as suffer any statues or figures in their houses, much less in their synagogues, or places of worship.

The use and adoration of images are things that have been a long time controverted in the world.

It is plain from the practice of the primitive church, recorded by the earlier fathers, that Christians, for the first three centuries after Christ, and the greater part of the fourth, neither worshipped images nor used them in their worship. However, the greater part of the Popish divines maintain, that the use and worship of images were as ancient as the Christian religion itself; to prove this, they allege a decree, said to have been made in a council held by the apostles at Antioch, commanding the faithful, that they may not err about the object of their worship, to make images of Christ and worship them. (Baron. ad an. 102.) But no notice is taken of this decree till 700 years after the apostolic times after the dispute about images had commenced. The first instance that occurs in any credible author of images among Christians, is that recorded by Tertullian de pudicit. c. 10. of certain cups, or chalices, as Bellarmine pretends, on which was represented the parable of the good shepherd carrying the lost sheep on his shoulders: but this instance only proves, that the church, at that time, did not think emblematical figures unlawful ornaments of cups or chalices. Another instance is taken from Eusebius, Hist. Eccl. lib. vii. cap. 18. who says, that in his time, there were to be seen two brazen statues in the city of Panas, or Caurena Philippi; the one of a woman on her knees, with her arms stretched out, the other of a man over-against her, with his hands extended to receive her; these statues were said to be the images of our Saviour, and the woman whom he cured of an issue of blood. From the foot of the statue representing our Saviour, says the historian, sprung up an exotic plant, which, as soon as it grew to touch the border of his garment, was said to cure all sorts of distempers. Eusebius, however, vouches for
none of these things: nay, he supposes that the woman who erected this statue of our Saviour was a Pagan, and ascribes it to a Pagan custom. Farther, Philologians, Eccl. Hist. lib. vii. c. 3. expressly says, that this itatue was carefully preserved by the Christians, but that they paid no kind of worship to it, because it is not lawful for Christians to worship heathen Gods in any other matter. The primitive Christians abstained from the worship of images, not, as the Papists pretend, from tenderness to heathen idols, but because they thought it unlawful in itself to make any images of the Deity. (Julin Mart. Apol. ii. p. 44.) Clem. Alex. Strom. 5. Strom. 1. and Protr. p. 46. Aug. de Civit. Delib. lib. vii. c. 5. and lib. iv. c. 32. Id. de Fide et Symp. c. 7. Laetant. lib. ii. c. 3. Tertull. Apol. c. 12. Arnob. lib. vi. p. 222.) Some of the fathers, as Tertullian, Clemens Alexandrinus, and Origen, were of opinion, that, by the second commandment, the arts of painting and engraving were rendered unlawful to a Christian, flying them evil and wicked arts. (Tert. de Idolol. cap. 3. Clem. Alex. Admon. ad Gent. p. 41. Orig. contra Celsum, lib. vi. p. 152.) The use of images in churches, as ornaments, was first introduced by some Christians in Spain, in the beginning of the fourth century; but the practice was condemned, as a dangerous innovation, in a council held at Eliberis in 305. Epiphanius, in a letter preferred by Jerome (tom. ii. ep. 6.), bears strong testimony against images, and may be considered as one of the first Iconoclasts. The custom of admitting pictures of saints and martyrs into the churches, for this was the first source of image worship, was rare in the latter end of the fourth century; but became common in the fifth; however, they were still considered only as ornaments; and, even in this view, they met with very considerable opposition. In the following century the custom of thus adorning churches became almost universal, both in the East and West. Petavius expressly says (De Incar. lib. xv. cap. 14.), that no statues were yet allowed in the churches; because they bore too near a resemblance to the idols of the Gentiles. Towards the close of the fourth or beginning of the fifth century, images, which were introduced by way of ornament, and then used as an aid to devotion, began to be actually worshipped. However, it continued to be the doctrine of the church in the sixth and in the beginning of the seventh century, that images were to be used only as helps to devotion, and not as objects of worship. The worship of them was condemned in the strongest terms by Pope Gregory the Great; as appears by two letters of his written in 601. From this time, to the beginning of the eighth century, there occurs no single instance of any worship given, or allowed to be given, to images, by any council or assembly of bishops whatever. But they were commonly worshipped by the monks and populace in the beginning of the eighth century; inomuch, that in the year 726, when Leo published his famous edict, it had already spread into all the provinces subject to the empire. See the history of the opposition to them under Iconoclasts. See Bower's Hist. of the Popes, vol. iii. p. 202, &c.

The Lutherans condemn the Calvinists for breaking the images in the churches of the Catholics, looking on it as a kind of sacrilege; and yet they condemn the Romanists (who are professed image-worshippers) as idolaters: nor can these be left keep pace with the Greeks, who go far beyond them in this point; which has occasioned abundance of disputes among them. See Iconoclasts.

The Mahometans have a perfect aversion to images; which was what led them to destroy most of the beautiful monuments of antiquity, both sacred and profane, at Constantinople.

The method of casting images, &c. among the Hindoos, is in the usual rule of simplicity, that, with the little variety of tools observed to be in use, has been so frequently remarked of eastern people. The following paragraph from the Hindoo Pantheon is descriptive of this process of Indian metalurgy. "The religiously and aesthetically, a duplicate of an image is a proof of its not being Hindoo workmanship, will appear in the description of their mode of casting in metals. First, the artist makes in wax the exact model, in every particular, of his intended subject, be it what it may, whether an image of a deity, or the hinge of a box: over this he plasters a covering of fine clay, well moistened and mixed, leaving an aperture at some part; when dry it is put on a fire, with the closer downwards, and the wax, of course, melts out. The plaster is now a mould, and receives at the aperture the molten metal, giving it externally, when cool, the exact form of its own concavity; in other words, of its original waxen model. The plaster or crust, or mould, is now broken off, and the image (lay) is produced sometimes sufficiently correct to require no after-polishing. The beautiful specimens of Hindoo mythology call at Benares, under the superintendence of Mr. Wilkins and some Pandits, have never since received the least polish or filing; but are now seen at the India-house museum, exactly as they made their first appearance from the mould: from these classical subjects several of my plates have been engraved.

"That Hindoo castles have but little muscular expression, is not, perhaps, to be considered altogether as defective, or attributed to want of skill in the artists. The human subject with them is rounder and plumper, left marked by angles and muscles, than the harder and ruder perfoms of higher latitudes, who, of course, exhibit more " nerve and pith." The models from which Hindoo founders have borrowed their forms, partake more of the roundness of Apollo, than of the muscle of Hercules."—Hin. Pan. p. 420.

IMAGE, in Rhetoric, also signifies a lively description of any thing in a discouer.

Images, in discouers, are defined, by Longinus, to be, in general, any thoughts proper to produce expreduions, and which preffent a kind of picture to the mind.

But, in the more limited fence, he fays, images are fuch discouers as come from us, when, by a kind of enthusiasm, or an extraordinary emotion of the fowl, we feem to fee the things whereof we fpake, and preffent them before the eyes of thofe who hear us.

Images, in rhetoric, have a very different ufe from what they have among the poets; the end principally propofed in poetry is adornment and furprize; whereas the thing chiefly aimed at in prose is to paint things naturally, and to shew them clearly. They have this, however, in common, that they both tend to move, each in its kind.

These images, or pictures, are of vaff ufe, to give weight, magnificence, and strength to a discouer. They warm and animate it; and, when managed with art, according to Longinus, feem as it were to tame and fubdue the hearer, and put him in the power of the fpeaker. See Hypotyposis.

IMAGINARY Quanti ties, or Impossible Quantities, in Algebra, are certain expreduions that arife in various algebraical and trigonometrical operations, to which no value, either ratioual or irrational, can be affigned, yet being fabricated in the equations whence they were deduced, are found to answer the condition of the question. These expreduions arise in the execution of the even roots of a negative quantity, and may be all reduced to one of the forms a \sqrt{-1}, or
imaginary Quantities.

or $b + a \sqrt{-1}$; a part only of this latter form being imaginary, but this, when taken collectively with the other part, renders the whole expression, like itself, imaginary. Whenever a quantity of this kind arises in the solution of a problem, it indicates that there are some conditions supposed that are impossible, and hence it may be said, that an imaginary expression is a sign of impossibility. Thus, for example, let there be proposed the two equations $x + y = 10$, and $xy = 26$, to find $x$ and $y$. First, $x = \frac{26}{y}$, therefore $y = 5 \pm \sqrt{-1}$, which is an imaginary expression; and hence we conclude, that the two conditions in the problem proposed were inconsistent with each other, that is, the product of no two quantities, whose sum is equal to 10, can be equal 26; or 10 cannot be divided in two parts, such that their product shall be equal to 26. But if we substitute this value of $y$ in the equation $y^2 - 10y = -26$, it will be found to answer the conditions required.

The first notice that is taken of imaginary expressions, or of the square root of negative quantities, is found in Cardan's algebra, who was most probably first led to the consideration of them, from the solutions of those cubic equations, which are now termed irreducible, and in which such expressions always arise, the roots of them being of the form $x = \sqrt[3]{b + a \sqrt{-1}} + \sqrt[3]{b - a \sqrt{-1}}$, each of which parts are imaginary; and thus it is, that some compensation takes place, and the root, though expressed in such terms, that no value can be given to either, is notwithstanding equal to a real quantity; this very singular circumstance, as soon as it was observed by Cardan, would no doubt lead him to an investigation of this species of quantity, but neither he, nor any other author, has yet been able to unravel the mysteries that these symbols involve, nor has any subject of mathematical inquiry led to more angry disputes: some affenting that such expressions as the mind can form no conception of, or at least of what they are intended to represent, ought not to be introduced into a science, the excellence of which consists in the rigour and evidence of its demonstrations, and that results thus obtained are unworthy of notice. On the other hand, it has been contended, that in all cases where the results thus deduced have been compared with those arising from the direct geometrical investigations, they have always been found perfectly to agree; and that the symbol $\sqrt{-1}$, although we can form no idea of what it represents, yet that being subjected to the same rules as other analytical symbols, the results derived from its introduction, are equally certain and conclusive: while others, taking a mean between these extremes, admit, that though, from analogy, there is no reason to doubt the truths obtained by means of these imaginary symbols, yet that it always adds a degree of conviction, when the results are verified by a more rigid analysis, and consequently that they ought not to be employed when other means are equally successful. Baron Maferon is decidedly of the first of these opinions, on which subject he has a work, entitled "A Difertation on the Use of the negative Sign in Algebra;" in which is demonstrated the nature of those signs, and the rules that are commonly given for working with them, and where he has also shown, that equations of the second and third degree may be effected without this introduction, or at least without the consideration of negative roots. Mr. Woodhouse's opinion on this subject may be seen in his "Analytical Calculations;" and a very ingenious paper on the same head is inserted in the "Philosophical Transactions" for 1778, by professor Playfair of Edinburgh, who has there given us sever. examples in which these imaginary expressions may be introduced to advantage into trigonometrical and other species of calculation.

Of the Algorithm of Imaginary Quantities. — After what has been said of the various opinions entertained by different able mathematicians on this subject, it will not be surprising to find that the algorithm of these quantities has also been unsolved, such as the rules for multiplication, division, and involution; some authors making the results in these operations different from others, and each assigning reasons for the rules he has given; it will, however, be useless to follow them through their particular arguments, as there are some of them specious, and many of them fallacious; we shall therefore barely state those reasons on which the rules now commonly adopted are founded. It is an established principle in algebra, that $a + bx + a = a$; and $a - x - a = a$; and hence, conversely, it follows, that $\sqrt{a} = a$ or $a$; but this ambiguity has no place, if we know how $a$ was generated, and have occasion to retrace the steps of our operation; that is, we cannot say that $x = a \sqrt{-a}$ $= \pm a$; nor that $x = a \sqrt{-a} = \pm a$; but the square root of $a$, in both these cases, is determined; that is, when considered with regard to its generation it has only one root; whereas, had its origin not been known, we must have given the ambiguous sign to the root $a$, and for this obvious reason, that we know not when $a$ is unconditionally assumed, whether it be the representative of $(a + a)$ or $(a - a)$; these being both expressed by the same symbol $a$. The restriction of which we have been speaking, sometimes takes place in equations; thus, for example, suppose it were required to find the value of $x$ in the equation $\sqrt{12} + x = 6 + \sqrt{x}$; we soon find $x = 4$: but there is this limitation, that the square root of $x$, or of 4, must necessarily be 2, and not $+2$; as the latter supposition will not answer the conditions of the equation; and the reason is obvious, namely, that we first found $\sqrt{x} = 2$; and then $x = 4$; but now, in re-tracing our steps, we must remember how this 4 was generated, and that it has not two roots, or has not the ambiguous sign belonging to it, as the square root of 4 would have it unconditionally assumed; in fact, the ambiguity in the extraction of the square root arises only in those cases in which we are acquainted with the generation of the quantity whose root is to be extracted; and here it must necessarily occur, because we have before agreed to represent both $(+a)$ and $(-a)$ by the same character $a$.

If therefore it be required to find the product of $\sqrt{-1}$ $\times \sqrt{-1}$, we see immediately that it is equal to $\sqrt{(-1)^2} = \sqrt{1}$; but under this limitation, that the root can only be expressed by $+1$, and therefore this product may always be represented by $-1$; or by $-1$; and it can never have any other form. If the product $\sqrt{-1} \times \sqrt{-1}$ was required, this would on the same principles be represented by $-1$; and the fourth power of $\sqrt{-1}$ is equal to $+1$; but with this limitation, that the root of this quantity can only be $-1$, and not $+1$; hence then we have $(\sqrt{-1})^2 = -1$, $(\sqrt{-1})^3 = \sqrt{-1}$ and $(\sqrt{-1})^4 = 1$. $(\sqrt{-1})^3 = \sqrt{-1}$: and consequently, the 6th power will be the same as the 24; the 7th the same as the $5^\text{th}$; the 8th the same as the 4th, and so on.
And exactly the converse of these rules must be observed in division. These examples involve all the cases that can arise; for if the quantities to be multiplied or divided be $\sqrt{-a} \times \sqrt{-b}$, we have only to write these, $\sqrt{a} \times \sqrt{-1} \times \sqrt{b}$, and $(\sqrt{-a})^2 \times \sqrt{-b}^3 = a \times (\sqrt{-1})^2 = -ab$; this product may be put under a simpler form, $\sqrt{-a} \times \sqrt{-b} = \sqrt{-1} \times \sqrt{a \times b}$; this shows the necessity of always separating the quantities into such factors, that only $-1$ is found under the radical, for according to the common rules for the multiplication of surds, we should have $\sqrt{-a} \times \sqrt{-b} = \sqrt{-a \times b} \times \sqrt{-1}$; this would be a fallacy, but the error is explained from what is observed in the preceding paragraph; for we have no right in this case to assume $\sqrt{-a} \times \sqrt{-b} = ab$, because we know its generation, and that it arose from the product of two negative signs, and therefore its root must necessarily be $-a$, and not $a$.

Having thus established rules for the multiplication, division, and involution of imaginary quantities, we shall give an example, on which a well known trigonometrical formula is deduced from an imaginary expression for the sine and cosine of an angle.

Let $a$ be an arc of a circle, of which the radius is unity, and let $e$ be the number that has unity for its hyperbolic logarithm; then the sine of the arc $a$, or sin. $a = e^a \sqrt{-1} + e^{-a} \sqrt{-1}$, which exponential and imaginary values of the sine and cosine are well known to geometers; and the investigation of them, according to the received arithmetic of impossible quantities, may be as follows.

Let $e = a + \pi$, then $e = e^a \sqrt{-1} + e^{-a} \sqrt{-1}$; to bring this fluxion to such a form that its fluent may be found by logarithms, both numerator and denominator are to be multiplied by $\sqrt{-1}$, then $e = e^a \sqrt{-1} \times \sqrt{-1} \times \sqrt{a + \pi}$, and (by form 6 Harmon. Meth.) $e = e^a \sqrt{-1} \times \log. \frac{e + \sqrt{a + \pi}}{e - \sqrt{a + \pi}}$.

Hence $\frac{e}{\sqrt{a + \pi}} = \sqrt{a + \pi} \sqrt{e^2 - 1}$; and therefore $\log. \frac{e + \sqrt{a + \pi}}{e - \sqrt{a + \pi}}$.

Again, if $a$ be considered as negative, its sign becomes also negative, and therefore $-a = \sqrt{-1} \times \log. \frac{e + \sqrt{a + \pi}}{e - \sqrt{a + \pi}}$; or $\sqrt{-1} \times \log. \frac{e + \sqrt{a + \pi}}{e - \sqrt{a + \pi}}$. Whence $\log. \frac{e + \sqrt{a + \pi}}{e - \sqrt{a + \pi}}$ = $-a \sqrt{-1}$.

If from this equation the former be taken away, there remains $\frac{-2a}{\sqrt{-1}} = e^a \sqrt{-1} - 1$; whence dividing by $2 \sqrt{-1}$, we have $a = e^a \sqrt{-1} - 1 - e^{-a} \sqrt{-1}$; and by adding together the equations, the value of the cosine may be found in the same imaginary terms which were assigned above.

Now by means of these expressions, all theorems may be demonstrated; it may for example be shown, that if $a$ and $b$ are any two arcs of a circle of which the radius is unity, then

$$\sin a + \cos b = \frac{a}{2} + \frac{e^{a} - 1}{2}$$

and $\sin a + \cos b = \frac{e^{a} - 1 + e^{-b} \sqrt{-1}}{2}$, therefore $a = e^{a} - 1 + e^{-b} \sqrt{-1}$, and $a = e^{a} - 1 + e^{-b} \sqrt{-1}$, which is a well known formula, and it has been deduced by means of the imaginary expressions that were first found, and various other examples of a similar nature might here be given.

This example, with several others, all tending to show the utility of these imaginary expressions, may be seen in the paper of Mr. Playfair before referred to, after which, and many ingenious remarks on this subject, the professor concludes his paper with the following observation: "Supported on a sure foundation, the arithmetic of impossible quantities will always be found a useful instrument in the discovery of truth, and may be of service when a more rigid analysis can hardly be applied; for this reason many researches concerning it, which in themselves might be deemed absurd, are yet not destitute of utility: M. Bernouilli has found, for example, that if $r$ be the radius of a circle, the circumference equal $4 \log. \frac{\sqrt{-1}}{\sqrt{-1} - 1}$, is considered as a quadrature of the circle, this imaginary theorem is wholly insignificant, and would deservefully pass for an abuse of calculation; at the same time we learn from it, that if in any equation the quantity $\log. \frac{\sqrt{-1}}{\sqrt{-1} - 1}$ enters, it may be made to disappear by the substitution of a circular arc."

We have said nothing in the foregoing paragraphs of a paper on the subject of imaginary quantities by M. Balsé, published in the Philosophical Transactions for 1806, in which the author endeavours to show, that imaginary quantities are signs of perpendicularity, a notion peculiar to himself; but there are other parts of the essay that display very considerable ability and ingenuity, but of which our limits will not allow a particular description.

**Imaginary Roots of an Equation.** are those roots, or values of the unknown quantity in an equation, which contain some imaginary expression. Thus the roots of the equation $x^2 - 10 y + 25 = 0$, are $y = \sqrt{-1}$; and the three roots of the cubic equation $x^3 + 1 = 0$, are $x = \sqrt[3]{-1} + \sqrt[3]{3} = -1 + \sqrt[3]{3}$; and $1$; of which the latter is the only possible value of $x$, the two former being imaginary or impossible. Sometimes the root of an equation may be represented by imaginary expressions, when it is in fact equal to a real quantity, as is the case in the solution of cubic equations of the irreducible form, according to the method of Cardan. Albert Girard was the first author who treated...
treated expressly on the imaginary roots of equations, and shewed that every equation has as many roots, either real or imaginary, as is denoted by the highest power of the index; see his "Inventiones Algebraicae." D'Alembert, in the Memoires of Berlin for 1746, first demonstrated, that every imaginary expression may be reduced to the form \( a \sqrt{-1} + b + a \sqrt{-1} \); and that the number of imaginary roots always enter in pairs, and consequently every equation of an odd dimension must have at least one real root, but an equation of an even degree may have all its roots impossible.

Waring also, in his "Meditations Algebraicae," has treated largely on this head, see chapters 2 and 3 of that work; in which will be found many excellent observations on this subject, with rules for determining the number of imaginary or impossible roots in a given equation of any dimensions.

The rule given by Sir I. Newton, in his Universal Arithmetic, for finding the number of impossible roots in an equation is as follows. Constitute a series of fractions, whose denominators are the series of natural numbers 1, 3, 5, &c., continued to the number representing the index or exponent of the highest power of the equation, and their numerators the same series of numbers, in the contrary order; and divide each of those fractions by that next before it, and place the resulting quotients over the intermediate terms of the equation; then under each of the intermediate terms; if its square, when multiplied by the fraction over it, be greater than the terms on each side of it, place the sign +; but if not, the sign -; and under the first and last term place the sign +; then will the equation have as many imaginary roots, as there are changes of the under written signs from + to - and from - to +. Thus, for the equation \( x^4 - 4x^3 + 4x^2 - 6x + 6 = 0 \), the series of fractions is \( \frac{3}{2}, \frac{3}{4}, \frac{1}{2}; \) and the second of these, divided by the first, gives \( \frac{3}{4} \); and the third, divided by the second, is also \( \frac{1}{2} \); hence these fractions placed over the intermediate terms will stand thus,

\[
\begin{align*}
\frac{3}{2} & + \\
- & + \\
\end{align*}
\]

Now, because the square of the second term multiplied by its supercubed fraction is \( \frac{1}{4}x^4 \), which is greater than \( 4x^3 \), the product of the two adjacent terms, therefore the sign + is set below the second term; and because the square of the third term multiplied by its corresponding fraction is \( \frac{1}{4}x^4 \), which is less than \( 24x^2 \), the product of the terms on each side of it, therefore the sign - is placed under that term; also the sign + is set under the first and last terms. Hence the two changes of the sign, first from + to - 1, and then again from - to +, indicate that the given equation has two impossible roots.

When two or more of the terms are wanted together, under the place of the first of the different terms write the sign -; under the second the sign +; under the third the sign -; and so on, always varying the signs, except that under the last of the deficient terms, which must always be +, when the adjacent terms on both sides of the deficient terms have contrary signs, as in the equation

\[
x^4 + a^2x^3 + a^3x^2 + ax + b = 0
\]

which has four imaginary roots.

This rule, however, may sometimes fail of giving the true number of impossible roots, on account of the roots being more than there can be changes of the sign, but this seldom happens.

This rule is demonstrated by Maclaurin, who has also given another of his own, which never fails; and the same has also been done by Mr. Campbell. See Philosophical Transactions, vol. 34 and 35.

**IMAGINARY ROOTS.** See Root.

**IMAGINATION,** as it has been often defined, is a power or faculty of the soul, whereby it conceives and forms ideas of things, by means of impressions made on the fibres of the brain, by sensation. This power depends on the memory. Ideas enter into the mind by the senses; the memory retains them; and the imagination compounds them.

Some writers have distinguished two sorts of imagination; the one, which consists in retaining the simple impression of objects, is called the **primary** imagination; the other arranges the images that are received, and combines them in a thousand ways, and is called the **adjective** imagination. The organs of our senses are composed of fibres, or little fibres, which, at one end, terminate in the outward parts of the body and skin, and at the other in the middle of the brain. These fibres may be moved two ways; either beginning at that end which terminates in the brain, or at that which terminates without. Now the agitation of these fibres cannot be communicated to the brain, but the soul will be affected, and perceive something. If then the agitation begins where objects make their first impression, viz. on the external surface of the fibres of our nerves, and is communicated thence to the brain; the soul, in that case, judges that what the senses is without, that is, the perceives an external object as present; but if only the anterior fibres be moved by the course of the animal spirits, or in some other manner, the soul then imagines, and judges, that what the senses is not without, but within the brain; that is, the perceives an object as absent; and herein lies the difference between sensation and imagination.

The faculty of imagining, or imagination, only consists, according to the doctrine of Malebranche, in the power which the soul has of forming images of objects, by producing a change in the fibres of that part of the brain, which may be called the principal part, because it corresponds to all the parts of our body, and is the place where the soul (if it may be so said) immediately refines. It matters not which that part is, nor whether the opinion of Willis be true, who places the common sense in the two bodies, called corpora striata, and the imagination in the corpus callosum; or that of Fernelius, who places sensation in the pit brain that accompanies the substance of the brain; or that of Descartes, who places it in the pineal gland; it suffices that there is some such part.

Since then the imagination only consists in a power which the soul has of forming images of objects, by impressing them on the fibres of the brain, it follows that the larger and more distinct the vellum or tracks of the animal spirits, which are the lines or strokes, as it were, of those images, are; the more strongly and distinctly the soul imagines the objects. Now as the breadth, depth, and channels of the strokes of a sculpture depend on the force whereby the graver acts, and the obedience which the copper yields, so the depth and channel of the tracks of the imagination depend on the force of the animal spirits, and the constitution of the fibres of the brain; and it is that variety which is found in those two things, to which we owe almost all the value difference which we observe in people's minds. On the one side are abundance and facility, brilliancy and fineness, largeness and smallness, of the animal spirits; and on the other hand, delicacy or grossness, humidity or dryness, stiffness or flexibility of the fibres of the brain; and lastly, a particular relation which the animal spirits may have with those fibres: from the various combinations of which things,

---

This page contains a detailed discussion on imaginary roots of equations, the concept of imagination in the context of the brain and its fibres, and the principles of Maclaurin's rule for determining the number of such roots. It also touches on the distinction between primary and adjective imagination and the role of the soul in perceiving external objects. The text is rich with philosophical and mathematical insights, reflecting the intellectual climate of the period.
IMAGINATION.

will result a sufficiently great variety, to account for all the different classes of objects by which appear in the minds of men: and from the same principle it follows that differences which is not

erved in the same person's mind, at different times, and under different circumstances, as in childhood, manhood, and old age, in sickness, health, &c.

It may here be observed, that the fibres of the brain are more444 agitated by the impression of objects than by the course of the animal spirits; and for this reason the soul is more affected with objects, which it perceives by sensation, and which it looks upon as present, and capable of giving it pleasure or pain, than by things perceived in imagination, which it judges to be distant. And yet it sometimes happens, that in persons whose animal spirits are extremely agitated by fasting, waking, drinking, a fever, or some violent passion, these spirits move the inward fibres of the brain as forcibly as inward objects do; so that these persons perceive things by sensation, which they should only perceive by imagination; for imagination and sensation only differ from each other, as the greater from the less. (See Malebranche, Recher de la Verité, lib. ii. See MADNESS, DELIRIUM, PHRENESY, MANIA, MELANCHOLY, &c.)

Imagination or fancy, says the ingenious Mr. Harris, though as to its origin it may be subfiequent to sensus, yet is truly prior to it in dignity and use. It is this which retains the fleeting forms of things, when things themselves are gone, and all sensation is at an end. The difference between sense and imagination appears from hence: that we have an imagination of things that are gone and extinct, which cannot be the objects of sensation. We have an early command over the objects of our imagination; whereas our sensations are necessary, when their objects are present. Imagination is also distinguished from memory, as the former views a scene of relief of sensation reproved within us, without thinking of its rise, or referring it to any sensible object, whereas memory views such relief, referring it at the same time to that sensible object, which in time past was its cause and origin, and recollection is the road which leads to memory, through a series of ideas, however connected, whether rationally or casually. Besides, imagination may exhibit, after a manner, things that are to come: but memory is confused in the strictest manner to the past. Hermes, p. 354, &c. ed. 2d.

Conception is frequently used as synonymous with imagination. Thus Dr. Reid says (Essays on the Intellectual Powers of Man, p. 597.) that "imagination, in its most proper sense, signifies a lively conception of objects of sight. This is a talent of importance to poets and orators, and deserves a proper name, on account of its connection with their arts." He adds, that "imagination is distinguished from conception, as a part from a whole." Professor Stewart (in his Elements of the Philosophy of the Human Mind, p. 135, 8vo.) distinguishes between conception and imagination. The functions of conception, according to this ingenious writer, is to present us with an exact transcript of what we have felt or perceived. But we have, moreover, a power of modifying our conceptions, by combining the parts of different ones together, so as to form new wholes of our own creation. Accordingly he employs the word imagination to express this power, which, in his opinion, is the proper sense of the word; if imagination be the power which gives birth to the productions of the poet andorator, this is not a simple faculty of the mind. It precipitates abstraction, to separate from each other, qualities and circumstances which have been perceived in conjunction; and also judgment and taste to direct us in forming the combinations. The two powers of conception and imagination, though distinct, are very nearly allied; and are frequently so blended, that it is difficult to say, to which of the two some particular operations of the mind are to be referred. There are also many general facts which hold equally with respect to both. Logicians in general have maintained, that conception, or imagination, often used as synonymous with it, is attended with no belief of the existence of its object. But this is a principle which professor Stewart has controverted. (See CONCEPTION.)

Imagination, according to Dr. Hartley, is the faculty to which we ascribe the recurrence of ideas in a vivid manner, without regard to the order of past impressions. All ideas, he says, are the result either of new impressions, or of association with preceding ideas, though the connection cannot in every instance be immediately traced out. In that state of mind denominated a reverie, a person is more attentive to his own thoughts than to external impressions, and therefore more of his ideas are deducible from association, and fewer from external impressions. And as dreams are the imaginings or reveries of a sleeping man, these are deducible from impressions lately received, from the state of the body, and particularly of the stomach and brain, and also from association. See DREAM.

Every man, says Dr. Reid, is conscious of a succession of thoughts, which pass in his mind while he is awake, even when they are not excited by external objects; and this continued succession of thought has, by modern philosophers, been called the "imagination." It is often denominated the "train of ideas," and is made up of many other operations of mind, as well as conceptions or ideas. Memory, judgment, reasoning, passions, affections, and purposes, in a word, every operation of the mind, excepting those of sense, is exerted occasionally in this train of thought, and has its share as an ingredient; so that we must take the word idea in a very extensive sense, if we make the train of our thoughts to be only a train of ideas. These trains of thought in the mind are of two kinds: they are either such as flow spontaneously, like water from a fountain, without any exertion of a governing principle to arrange them, or they are regulated and directed by an active effort of the mind with some view and intention. These two kinds, however different in their nature, are for the most part mixed in persons awake and arrived at years of understanding; and they take their denomination from that which is most prevalent. It is to be observed, however, that a train of thought, which at first was studied and composed, may by habit present itself spontaneously. These trains of ideas, which are spontaneous must be the first in the order of nature. When the work of the day is over, and a man lies down to relax his body and mind, he cannot cease from thinking, though he defers it. Something occurs to his fancy; that is followed by another thing; and so his thoughts are carried from one object to another, till sleep clothes the scene. In this operation of the mind, it is not one faculty only that is employed. Though memory acts the most considerable part, other powers are exercised and directed to their proper objects. In reveries of this kind we judge and reason, form an opinion of persons and things, and pass sentence accordingly. Such trains of thought may be called historical. Others may be denominated romantic, in which the plot is formed by the creative power of fancy, without any regard to what did or will happen. In these also, the powers of judgment, taste, moral sentiment, as well as the passions and affections, come in and take a share in the execution. Mr. Addison, in the "Spectator," calls this play of the fancy "castle-building." The romantic scenes of fancy are most commonly the occupation of young minds, not
not yet so deeply engaged in life as to have their thoughts taken up by its real cases and business. In persons come to maturity, there is even in these spontaneous fallies of fancy some arrangement of thought. But how is this arrangement effected? It has all the marks of judgment and reason, yet it seems to go before judgment, and to spring forth spontaneously. It is highly probable, that whatever is regular and rational in a train of thought, which presents itself spontaneously to a man’s fancy, without any study, is a copy of what had been before composed, by his own rational powers, or those of some other person. They may be the result of habits previously acquired. In order to account for the regular arrangement of these operations of fancy that are in a great degree spontaneous, we need only recur to the natural powers of judgment and invention, the pleasure that always attends the exercise of those powers, the means we have of improving them by imitation of others, and the effect of practice and habits, without supposing any unaccountable attractions of ideas by which they arrange themselves. Besides the original powers which fancy pos sesses, which are very different in different persons, it has likewise more regular motions, to which it has been trained by a long course of discipline and exercise; and by which it may extent, and without much effort, produce things that have a considerable degree of beauty, regularity, and design. Upon the whole we may observe, that every thing that is regular in that train of thought, which we call fancy or imagination, from the little delusions and reveries of children, to the grandest productions of human genius, was originally the offspring of judgment or taste, applied with some effort greater or less. In order to account for this successive train of thought in the mind, a theory, which was suggested by Mr. Hobbes, has been more distinctly explained by Mr. Hume. That author thinks, that the train of thought in the mind is owing to a kind of attraction which ideas have for other ideas that bear certain relations to them. The relations which produce this attraction of ideas, he thinks, are these three only, viz. causation, con tinuity in time or place, and similitude. These, according to this writer, are the only general principles that unite ideas. Dr. Reid very justly observes, that this enumeration of the relations of things is very inaccurate. Lord Kames, in his "Elements of Criticism," and Dr. Gerard in his "Essay on Genius," have given a much fuller and juster enumeration of the causes that influence our train of thinking. Among these works we refer. Aft all, this attraction of ideas may be resolved into the power of habit. As far as it is in our power to direct, we are ourselves directed by the principles common to men, by our appetites, our passions, our affections, our reason, and our conscience; and that the trains of thinking in our minds are chiefly governed by these, according as one or another prevails at the time, every man will find in his experience. We shall here subjoin two or three reflections of a more practical nature, and of higher importance. It must be allowed that our happiness or misery in life, that our improvement in any art or science we profess, and that our improvement in real virtue and good ness, depend in a very great degree on the train of thinking that occupy our minds in our spare hours; "As far, therefore, as the direction of our thoughts is in our power (and that it is so in a great measure cannot be doubted), it is of the utmost importance to give them that direction which is most subservient to those valuable purposes. The human imagination is an ample theatre, upon which every thing in human life, good or bad, great or mean, laudable or base, is acted. How happy is that

mind in which the light of real knowledge diphens the phan toms of superstition; in which the belief and reverence of a perfect all-governing mind calls out all fear, but the fear of acting wrong; in which serenity and cheerfuld, innocence, humanity, and candour, guard the imagination against the entrance of every unhallowed intruder, and invite more amiable and worthy guests to dwell! There shall the Muses, the Graces, and the Virtues, fix their abode; for every thing that is great and worthy in human conduct must have been conceived in the imagination before it was brought into execution. And many great and good designs have been formed there, which, for want of power and opportunity, have proved abortive. The man, whose mind is occupied by these guests, must be wise; he must be good; and he must be happy." Reid’s Essays on the Intellectual Powers of Man, Eft. iv.

**IMAGINATION, Pleasures of the, are referred by Mr. Addi son, in the sixth volume of the "Spectator," to three sources, viz. beauty, grandeur or sublimity, and nobility; which see respectively. These pleasures, as the author describes them, are such as arise from visible objects, either when we have them actually in view, or when we call up their ideas into our minds by paintings, statues, descriptions, or any the like occasion. These pleasures are not fo gross as those of sense, nor so refined as those of the understanding. They are more conducive to health than those of the understanding, which are wrought out by dint of thinking, and attended with too violent a labour of the brain. Delightful scenes, whether in nature, painting, or poetry, have a kindly influence on the body as well as the mind, and not only serve to clear and brighten the imagination, but are able to dispel grief and melancholy, and to set the animal spirits in pleasing and agreeable motions. The Creator hath wonderfully displayed his benignity by endowing us with the powers of taste and imagination for participating such pleasures; and the additional embellishment and glory, which, for promoting our entertainment, the Author of nature hath poured forth upon his works, is one striking testimony, among many others, of benevolence and goodness. This thought, first suggested by Mr. Addison, Dr. Akenfide, in his "Poem on the Pleasures of the Imagination," has happily purified 

"— — —— Not content With every food of life to nourish man, By kind illusions of the wandering fene; Thou mak’st all nature, Beauty to us, Or Muft to his ear. — — — —  "

**IMAGINATION, Influence of, on the corporal Frame.** The influence of this faculty of the mind upon the constitution and operations of the body has been the subject of some discussion from very early times. But it is remarkable, that while philosophers and physicians attributed to it a series of phenomena, which a more accurate investigation has thrown to arise from other causes; they at the same time overlooked, or rather ascribed to different sources, many other facts, which subsequent inquiry has proved to originate from the influence of the imagination. The principal operation of this faculty, acknowledged by the older physicians, was that of pregnant women upon the body of the child in utero; and this opinion, although it was long ago satisfactorily refuted by some philosophical observ errs, (see Dr. Black’s answer to the twelfth chapter of Dr. Turner’s treatise on Diffuses of the Skin, and Lettres fur le Pouvoir de l’Imagination des Femmes enceintes, Paris 1745,) has been maintained by many other writers of reputation, and is still popularly current, if not received as an established truth by the lef enlightened part of the medical profession. Nothing, however, we conceive, but the
IMAGINATION.

the inveteracy of the judic peace, and can account for the support of a doctrine, which reason, experience, and anatomical science concur to refute. On the other hand, the phenomena are actually occasioned by the operation of the imagination on the corporeal functions, are far more numerous, and yet at times appear extraordinary, that they merit a particular investigation: for it is the consequence only of inattention to the subject, and of the general appetite of mankind, especially in ages of ignorance, for whatever is occult and mysterious, that the principle was not long ago established, and the facts rendered familiar to all. Rational science, built upon observation and experiment, has in a great measure banished the notions of magic and witchcraft, even from the peasantry; but it remained for the philosophical minds of a Franklin, a Lavoisier, &c. to propound the mysteries of Mefmer, and the other professors of animal magnetism, at Paris, near the close of the eighteenth century; and for that of a Haygarth, to expose the rationale of Perkins and the metallic tradesmen, in our own country, at the beginning of the nineteenth. (See Rapport des Commissaires chargés par le Roy de l'examen du Magnétisme Animal, Paris 1784.; and a pamphlet, "On the Imagination as a Cause and as a Cure of Disorders of the Body, exemplified by fictitious Tractors and epidemical Convulsions;" by John Haygarth, M.D. &c. Bath, 1800.) In truth, the influence of the faculty of imagination over the functions of the body affords an explanation of numerous facts in the moral as well as physical history of man, which have been accounted for upon various occult principles; such as diabolical or demoniacal possession; the power of incantations and amulets; the miraculous influence of relics, images of saints, &c.; the operations ascribed to some magnetic or electrical principle in nature; to the touch of kings, and of various gifted persons; and many other circumstances.

Before we pursue this interesting inquiry, however, we shall dismiss the subject, so far as relates to the supposed operation of the imagination in pregnant women.

I. All the varieties of deformity and monstrosity, as well as of cutaneous marks and blemishes of infants, were formerly ascribed to the imagination of the mother dwelling upon some analogous object, or to her disappointed longings for some particular article of food or drink. Hippocrates himself observes, that the desire of a pregnant woman is capable of marking the tender infant with the thing desired; and subsequently, the observations to this effect, and the number of histories illustrative of it, have been so multiplied by authors of reputation, that the defenders of the doctrine still appeal to experience, as decisive in favour of the ancient and popular opinion; they consider the matter as established upon the evidence of indubitable history. But to those who are acquainted with the records of medicine, it is not necessary to state, that they abound with so many extravagant and fabulous details, which have been collected and repeated with the utmost credulity, that to admit them as truths would require a renunciation of the best principles of modern science. It is enough to peruse the marvellous collections of Schenck and Marcellus Donatus, to be satisfied of this proposition, as to the occurrences themselves, but in respect to the causes of the phenomena, (which is a matter of difficult investigation,) authority is of no weight, when placed in opposition to found anatomical and physiological principles.

The most common deformities, attributed to the influence of the mother's imagination, are spots, tubercles, &c. on the skin, the commonality of a red or purplish colour, which are supposed to resemble different parts of fruit, such as mulberries, cherries, strawberrys, &c. or the flanks of port-

Vol. XVIII.

wine; and other spots covered with a downy hair, and compared to the skin of a mouse, a mole, &c. These appearances have been commonly ascribed to the disappointed longings of the female, during utero-gestation, for the particular fruit, which is supposed to be impressed on the skin, or to some agitation of mind, occasioned by these things being thrown at her, or certain animals jumping upon her. But many more extraordinary phenomena are on record. Among the caesa stated by Turner, we find an instance of an "infant's head pierced quite through by reason of an affright of the mother;" another of a child born with the leg broken or distorted, by the mother looking on a crucifix, and viewing the broken limbs of one of the male-factors by the side of Christ; of a child of Sir J. B. which was born wanting one hand, in consequence of his lady being frightened, when pregnant, by the unexpected view of a beggar's stump arm upon her coach door; of another child, which, in consequence of the mother being pursued by her husband with a drawn sword, threatening to cut her over the forehead, near the time of her delivery, was brought forth with a large wound on its forehead, from which a fatal hemorrhage took place; and of another infant, whose abdominal vifera hung out all naked below the navel at birth, in consequence of the mother having been compelled to witness the killing of a calf three months before parturition, at the opening of which she felt an extraordinary motion in her self, when she saw how the bowels came tumbling from the belly; not to mention instances of children born with the head of a cat, with a hairy skin and bear's claws, or of different colour from that of the parents, in consequence of frights, or of the frequent contemplation of pictures of bears, or of negroes, &c. See Turner on Difficulties of the Skin, chap. xii.

Now, in all these instances, the impressions on the imagination are alleged to have occurred in the course, or even at an advanced period, of the pregnancy. Before this occurrence then, it is presumed that the child in utero was of the natural and perfect form; that is, the infant, which is born with a large discolouration or protuberance on its skin, had, up to this period, a fair and smooth skin; that the child who is born with fix toes, had, till then, only five; that the child, brought forth with one leg or one arm, had originally two; and the monster produced with the head of a cat, had originally a natural human head, until the mother was frightened by the cat getting into her bed, when she was "big with child" (Turner); and so on, with regard to every other preternatural appearance, whether it be an entire, or a part of the body. It seems almost sufficient barely to flate the matter in this light, in order to demonstrate the absurdity of the opinion. For surely it does not require a train of reasoning or of experiment to prove, that neither man nor woman can, by the force of imagination, "add an inch to the stature," or take an inch from it, or transform any part of their bodies into the semblance of other animals, or of vegetables and fruit. It is not less clear, that no woman can, by an effort of imagination, form a child; and, if not a whole child, neither can she add new parts to a child already completely formed, nor destroy any of the parts so formed, nor transmute any of those parts into other forms of structure. For example, let us take the instance of the lady, who, when advanced five or six months in her pregnancy, was so terrified by a beggar thrashing the stump of an amputated arm into her coach, that the child, of which she was afterwards delivered, was born with the stump of an arm resembling that of the beggar. Let us consider what an operation must be performed to work this effect: a child at the term of five
or six months is of considerable bulk; and the arm itself not small. This arm, then, must drop off by the power of imagination: there must be no blood lost to endanger the life of the child; and the wound must be healed before the birth. This might seem sufficiently improbable; but, admitting that the child could drop off by the force of fancy in the mother, it must full remain in the uterus until the delivery; and the bones at least could not patruify and waft away, although the limb might. But it never was pretended that, in cases of this nature, any part of the deficient limb was found by the midwife. And, what is a material point in the argument, the stumps of all such imperfect limbs have a smooth and regular skin, which plainly indicates that they were from their first formation of the same figure: for had there been a wound, there would have been a scar; and scars are very diliguinguishable from found skin.

When we consider the nature of the connection between the fetus in utero and the mother, this view of the subject is still farther confirmed. The infant is not one body with the mother, as some writers have asserted, any more than the plant is one substance with the earth, which nourishes it. (See Lettres sur le Pouvoir de l’Imagination de Femmes enceintes, Paris, 1747.) There is no communication of nerves whatever between the mother and the child, nor is there any direct vascular communication: the infant has its own distinct circulation of blood, carried on by the action of its own heart and arteries, which last do not terminate in the vessels of the mother, but in the veins of the child, which reconduct the blood to its heart: nor is there any direct communication of the vessels of the mother with those of the fetus. (See Enthyno.) This identity of the circulation and nervous system of the fetus renders it altogether inconceivable that the sensations, fears, or desires of the mother should be in any way communicated to it; or that any impression on the imagination of the mother should produce any changes in its structure, or appearance. As it never happens, by any feris of fancies or passions, that the figure of the objects of them is traced upon the skin of the mother; so it is equally impossible, and more improbable, that such changes or appearances should be impressed upon the infant, thus infused from any nervous influence of the parent.

Besides, with respect to the navi, moles, and other marks on the skin, it is obvious to those who have paid any attention to them, that the resemblance which they are said to bear to various sorts of fruit, &c. is purely fanciful; that they are generally of two or three kinds, consisting of a multiplicity, or network, of small blood-vessels, which constitute the common red and purplish marks; or of large brown moles, &c.; and that the fancied occurrence of greater rednesses in those of the former clas, which are compared to fruit, at the time when such fruit is ripe, arises merely from the increased circulation and distention of the small blood-vessels in hot weather. When these and other deformities are congate, the mother, already puffed with the belief that some such cause as could affect the mind must have existed, is not long at a loss; her memory or her prejudice soon furnishes her with some fact, which was never attended to perhaps when it happened, and the influence of her child is added to the long catalogue of those which preceded. For the minute accordance of the fact is never required. Thus there is no defect more common than that of a hare-lip; and when this appears, the mother does not fail to recollect, that at some time in the course of the nine months she had wished for a hare, or had been frightened by a hare, or had by chance seen somebody with a hare-lip, no matter which, the occurrence is satisfactorily ac-

counted for, and the fact is establisht. Yet had not medical observers given this name to the disease, the actual resemblance of a human countenance, thus deformed, to that of a hare, would not perhaps readily suggest itself.

But, the truth is, although we cannot explain the causes of these irregularities and monstrosities of human births, any more than various other anomalies and lobus nature in the animal and vegetable world in general, yet we must refer them all to the same origin: for in regard to his corporeal frame, his generation, and mechanical structure, man is subject to the same laws with the rest of the living creation. The growth of the human fetus seems not to differ from the development of the germ, in the eggs of oviparous animals, or in the seeds of plants. All these are liable to every conceivable variety of form; to deformities, redundancies, defects, and anomalous dispositions of parts, both internal and external: yet the influence of imagination is, in the latter cases, out of the question. But it would seem, that a nut with two kernels, a chicken with two heads, or a child with a double head, body, and limbs, (a monstrosity not very rare,) are upon a very similar footing; and, that it would be as philosophical to attribute the monstrous chicken to the imagination of the hen that hatched the eggs, or the double nut to the fancies of the hazel-buff, as to ascribe the extraordinary infant to the fears or apprehensions of the mother.

In all the above examples, the changes, supposed to be effected by the imagination on the child in the womb, are said to take place after the development of the germ or embryo has considerably advanced; and it is to such operations only that our attempts at refection apply. For as to the mysterious influence of the mind in the act of procreation, on which "the callipedia, or the art of begetting beautiful children" depends, although much has been said on the subject in all ages, we confine ourselves altogether unable to enter into the discussion. The original conception may doubles be modified by circumstances, which are incapable of producing sub sequent changes in the embryo. If the placing of it, or the diligent operation before the vessels at the time of their conjunction, as mentioned in holy writ, (Gen. chap. xxx.) was the occasion of the generation of black and white lambs; the notions of some ancient and modern philosophers and poets may be verified in respect to the human conception. Thus the tyrant Dionysus, who was deformed and ill-favoured himself, in order that he might have a comely issue, is said to have always had a beautiful picture set before his wife in the bed-chamber, that by the force of fancy the might conceive the likenes of it. Galen attributed the same effect to the sight of a picture. (Lib. de Theriac ad Pifton. c. 14.) And the poet Hesiod exhorts his friends not to fret about the work of procreation after they return from funerals, lest the sorrowful idea be transmitted to the conception, and the tender focus marked with some frightful character.

"Μηδ' ἂν θεώ τοῦτο, καὶ καθώς ἢ παντίς, Φανάρικον γυνώ, ἀλς ἀδαμπότι, ἀπ' ἀναστ."

Dr. Darwin has many speculations upon this subject; but he refers all the influence to the imagination of the male parent, and denies the influence of that of the female, not only during the period of pregnancy, but at the moment of conception; and he thinks the callipedia is an art which may be taught: "but," he properly observes, "the manner of accomplishing this cannot be unfolded with sufficient delicacy for the public eye." See Zoönomia, vol. i. sect. xxxix. 6 and 7.

11. Although,
II. Although, however, we may be convinced of the error of ascribing the actual changes of structure, which constitute the deformities and monstrosities of infants, to the imagination of the mother, operating upon the embryo after it is completely developed; yet we have the most satisfactory evidence of the powerful influence of this faculty over the nervous and vascular system, and of effects resulting from this influence, which might à priori be deemed equally extraordinary, as the metamorphoses abovementioned. Who, for example, could suppose that, on the one hand, many painful, paralytic, and convulsive affections, both local and general, could be removed by impeachment exciting only the imagination of the patient, or that, on the other hand, various anomalous situations, actual furcope or swooning; and even the most violent epileptic and hydric convulsions, could be occasioned by influencing the same faculty? We conceive, however, that no fact in physiology is more clearly demonstrable. We shall first state the evidence which experiment has established, and then the inferences which may be deduced, and extended to many other analogous phenomena. The most striking illustration is to be found in the history of

§ 1. Animal Magnetism.—In consequence of the extent to which the practice of animal magnetism, as it was called by its inventor, M. Meffmer, was carried in Paris, the French king appointed a committee, consisting of four physicians, and five members of the Royal Academy of Sciences, to investigate the matter, in the year 1783. Among the latter were M. Bailly, Laveil, and Dr. Franklin, who was at that time the American minister at Paris. This agent, which Meffmer pretended to have discovered, he affirmed, was “a fluid universally diffused, and filling all space, being the medium of a reciprocal influence between the cerebral bodies, the earth, and living beings; it inflamed itself into the sublimity of the nerves, upon which therefore it had a direct operation:—it was capable of being communicated from one body to other bodies, both animal and inanimate, and that at a considerable distance, without the assistance of any intermediate substance; and it exhibited in the human body some properties analogous to those of the lodestone, especially its two poles. This animal magnetism,” he added, “was capable of curing directly all the disorders of the nervous system, and indirectly other maladies; it rendered perfect the operation of medicines; and excited and directed the salutary crises of disfases, so that it placed these crises in the power of the physician. Moreover, it enabled him to ascertain the state of health of each individual, and to form a correct judgment as to the origin, nature, and progress of the most complicated disfases, &c.” In short, he said, “La Nature oisie dans le magnétisme un moyen universel de guérir et de préserver les hommes.” (See Memoire sur la Decouverte du Magnetisme Animal, par M. Meffmer, Doct. en Med. de la Faculté de Vienne, 1779.—Allo his Precis Historique des Faits relatifs aux Mag. An. jujues en Avril, 1781.) Mons. Defont, a pupil of Meffmer, also practiced animal magnetism at Paris, and undertook to demonstrate its existence and properties to the companions. He commenced his instructions by reading a memoir, in which he maintained, that “there is but one nature, one disease, and one remedy; and that remedy is animal magnetism.”

The first step of the companions was to examine the mode and instruments of operation, and the effects of the agent. It was observed that M. Defont operated upon many individuals at the same time. In the middle of a large room was placed a circular chaff of oak, railed about a foot from the floor, which was called the bouquet; the lid of this chaff was pierced with a number of holes, through which there issued moveable and curved branches of iron. The patients were ranged in several rows round the chaff, each at an iron branch, which, by means of its curvature, could be applied directly to the diseased part. A cord, which was passed round their bodies, connected them with one another; and sometimes a second chain of communication was formed by means of the hands, the thumb of each one's left hand being received and pressed between the fore-finger and thumb of the right hand of his neighbour. Moreover, a piano-forte was placed in a corner of the room, on which different airs were played; found being, according to the principles of Meffmer, a conductor of magnetism. The patients, thus ranged in great numbers round the bouquet, received the magnetic influence at once by all these means of communication; by the branches of iron which transmitted to them the magnetism of the bouquet; by the cord entwined round the body; by the union of thumbs, which conveyed to each the magnetism of his neighbour; and by the sound of the music, or of an agreeable voice, which diffused the principle through the air. The patients were, besides, directly magnetised, by means of the finger of the magnetiser, and a rod of iron, which he moved about before the face, above or behind the head, and over the diseased parts, always observing the distinction of the magnetic poles, and fixing his countenance upon the individual. But above all, they were magnetised by the application of the hands, and by the fingers to the fingers, to the sterno-clavicle, and the abdominal regions, which was often continued for a long time, occasionally for several hours together.

The patients, subjected to this treatment, at length began to present very various appearances in their condition, as the operation proceeded. Some of them were calm and tranquil, and felt nothing; others were affected with coughing and spitting; others again experienced flight pains, partial or universal heats, and considerable perspirations; and others were agitated and tortured with convulsions. These convulsions were extraordinary in their number, severity, and duration. The companions saw them, in some instances, continue for three hours, when they were accompanied with expectoration of a viscid phlegm, which was ejected by violent efforts, and sometimes streaked with blood; one young man often brought up blood copiously. The convulsions were characterized by violent involuntary motions of the limbs, and of the whole body, by spasms of the throat, by agitation of the epigastrium and hypochondria, and wandering motions of the eyes, accompanied by piercing shrieks, weeping, inordinate laughter, and hiccup. They were generally preceded or followed by a flage of languor and rambling, or a degree of drowsiness and even of coma. The least unexpected noise made the patients start; and it was remarked, that even a change of measure in the air, played upon the piano-forte, affected them, so that a more lively movement increased their agitation, and renewed the violence of their convulsions. Nothing can be more surprising, or more inconceivable to those who have not witnessed it, than the spectacle of these convulsions, say the companions; all seem to be under the power of the magnetiser; a figure from him, his voice, his look, immediately roufes them from a flage even of apparent sopor. In truth, they add, it was impossible not to reconnit, in these convulsions effects, a great power or agency, which held the patients under its domination, and of which the magnetiser appeared to be the sole depository. See Rapport des Commissaires chargés par le Roi, de l'Examen du Magnétisme Animal; à Paris, 1784.

Such, then, were the phenomena (of the reality of which they could not doubt) produced by the operation of this
new agent, the nature and origin of which it was the duty of the commissioners to investigate. This convulsive and lethargic state, it may be noticed, was considered as a crioph, such as the constitution or the art of medicine is enabled to effect, for the purpose of curing diseases; and for the sake of brevity, we shall adopt the term, to express this occurrence, regardless of the hypothesis which led to its use.

On witnessing the same experiments, frequently repeated, the commissioners remarked, that among the patients who fell into the crioph, there were always many women, and very few men; that the crioph were not effected in less than the space of an hour or two; and that as soon as one person was thus taken, the rest were similarly feized in a very short time. But they were unable to obtain any satisfactory results from experiments made upon many persons at once. They resolved, therefore, to endeavour, by experiments upon individuals, in a more private way, to ascertain the direct effects of the newly discovered agent on the animal economy, in a state of health; which, if the agent existed, could of course be rendered manifest by its effects: and they determined to become themselves the subjects of the first experiments. No inquiry was ever conducted in a more philosophical manner, or terminated in a more complete and unequivocal development of the nature of the subject. Great and extraordinary as the powers of this new agent seemed to be, the phenomena were proved to be referrible solely to the imagination of the parties magnetized.

The commissioners submitted to be magnetized together, excluding all strangers, by M. Delkon, once a week, for the space of two hours and a half; they were ranged round the bague, encircled by the cord of communication, with an iron branch from the bague reposing upon the left hypoconch of each, and forming from time to time the communication of thumbs: they were magnetized by the fingers or the metallic rod being moved about and presented to different parts of the body, as well as by the pressure of hands on the pit of the stomach and sides of the belly. The most irritable and delicate of the commissioners were magnetized the most frequently, and for the longest time. But none of them experienced any effects or sensations; or at least any that could be ascribed to magnetism. Three of them were valetudinarians, and some of their usual uneasy feelings were excited by the fatigue, and partly by the strong pressure made on the stomach. They submitted to the experiment on three days successively: still, without any effect. The quiet and silence of the eight commissioners, thus magnetized, without any uneasiness or any new sensation, formed the most perfect contrast with the noise, agitation, and disorder of the public magnetism: here was the magnet without any influence, and the operator despooled of his power. They were warranted, therefore, in concluding, "that magnetism has no agency in a state of health, or even in a state of flight indisposition."

They resolved, then, to make their next trials of its influence upon persons actually diseased; and seven persons, of the lower classes, were magnetized by M. Delkon, in the presence of the commissioners, at Dr. Franklin's house. Two women, the one aiahmatic, the other with a swelling on the thigh, and two children, the one fix and the other nine years of age, felt nothing, and remained unaffected. One man, with diseased eyes, felt a pain in the ball of one of them, which was so disagreeable, and moved quickly about for a considerable time; but when the other eye, which was most diseased, was magnetized, he felt nothing. A nervous, hysterical woman, to whom the pressure of the abdomen was painful, and who had a hemis, felt the pain in the head when the finger was pointed near the rupture, and that the lost her breath when it was brought opposite the face. When the finger of the magnetizer was repeatedly moved up and down, the experienced some catchings of the muscles of the head and shoulders, like one surprised and afraid. The seventh patient, a man, suffered some effects of the same fort, but much less marked.

Four persons, two ladies and two gentlewnen, of good education, and in bad health, were afterwards magnetized. Three of these underwent the operation several times, and felt nothing: but the fourth, a nervous lady, being magnetized during an hour and twenty minutes, generally by the application of the hands, was several times on the point of falling asleep, and felt some degree of agitation and uneasiness. On a subsequent occasion, a large company, assembled at Dr. Franklin's, (who was confined by illness,) were all magnetized, including some patients of M. Delkon, who had accompanied him thither: there were present several Americans, one of whom, an officer, had an intermittent fever; yet no person experienced any effects, except M. Delkon's patients, who felt the same sensations to which they had been accustomed at his public magnetizing.

These experiments, then, furnished some important facts. Of fourteen invalids, five experienced some effects from the operation, but nine felt not whatever. All the effects, in the nervous lady, however, might be occasioned by the irksomeness of the public posture for so long a time, and by her attention being strongly fixed upon her feelings; for it is frequently sufficient to think of these nervous attacks, or to hear them mentioned, in order to reproduce them when they are habitual. The three other infinences occurred among persons of the lower classes: and this circumstance was remarked with surprize by the commissioners: that the only effects, which could be ascribed to magnetism, manifested themselves in the poor and ignorant; while those who were better able to observe and to describe their sensations, felt nothing. At the same time, it was observed, that children, although endowed with the peculiar sensibility of their age, likewise experienced no effect. The notion, that these effects might be explained by natural causes, therefore, suggested itself to the commissioners. "If we figure to ourselves," they observe, "a poor ignorant person, suffering from diffuse, and anxious to be relieved, brought before a large company, partly confiding of physicians, with some degree of preparation and ceremony, and subjected to a novel and mysterious treatment, the wonderful effects of which he is already perused that he is about to experience; and if, moreover, it is recollected, that he is paid for his compliance, and flappoes that the experimenters will be gratified in being told that he perceived certain operations; we shall have natural causes by which these effects may be explained, or at least very legitimate reasons for doubting that the real cause is magnetism." Rapport des Commiff. p. 32.

Since the flappoes effects of the animal magnetism, then, were not discoverable in those who were incredulous; there was great reason to suspect, that the impressions which were produced, were the result of a previous expectation of the mind, a mere effect of the imagination. The commissioners, therefore, now directed their experiments to a new point, namely, to determine how far the imagination could influence the sensations, and whether it could be the source of all the phenomena attributed to magnetism.

The commissioners had recourse now to a Mr. Junel'in, who magnetized in the same way with M. M'far and Delkon, except that he made no distinction of the magnetic poles. Eight men and two women were operated on by M. Junel'in; but none of them experienced any effect. At length
length a female servant of Dr. Le Roy, who was magnetized in the forehead, but without being touched, said she perceived a faint heat there. When M. Jumelin moved her hand about, and presented the extremities of his five fingers to her face, she said that she felt as if there were a flame moving about: when magnetized at the stomach, she declared that the heat was there; at the back, and the fame heat was there: she then affirmed that she was hot all over the body, and suffered a head-ache. Seeing that only one person, out of eleven, had been beneficent of the magnetism, the commissioners thought that this person was probably puffed up of the most mobile imagination. They therefore tied a bandage over her eyes, and she was magnetized again: but the effect no longer accorded with the parts to which the magnetism was directed! When it was applied successively to the stomach and to the back, the woman only perceived the heat in her head, and a pain in her eyes, and in the left ear! The bandage was removed, and M. Jumelin applied his hands to the hypochondre; she immediately perceived a heat of heat in those parts; and, at the end of a few minutes, said that she was faint, and actually swooned. When she was sufficiently recovered, her eyes were again bandaged; M. Jumelin was then removed to a distance, silence was commanded, and they made the woman believe that she was again magnetized. The effects were now precisely the same, although no one operated, either near her or at a distance; she felt the same heat, particularly in the back and loins, and the same pain in the eyes and ears! At the end of a quarter of an hour, a sign was made to M. Jumelin to magnetize her at the stomach; he did so, but she felt nothing; he magnetized her back, but without effect; in fact the heat of the back and loins gradually ceased, and the pains in the head remained!

Here, then, was demonstrative evidence of the operation of the imagination. When the woman saw what was done, the sensations were placed in the parts magnetized; but when she could no longer see, they were referred to the most distant parts, where no magnetism was directed; and, above all, they were equally felt, when she was not magnetised at all, and not felt when she was magnetised, after a little repose, but unknown to herself. The feeling of a nervous woman, when made the subject of a mysterious experiment, and continued in a posture of restraint for a considerable time, is explicable upon natural causes. This experiment also showed, that the distinction of poles was purely chimerical. It was repeated the following day upon a man and a woman, with the same results. Sensations, felt when they were not magnetised, could only be the effect of imagination: and it was found only necessary to excite and direct the imagination, by questions, to the parts where the sensations were to be felt, instead of directing the magnetism upon those parts, in order to produce all the effects. A child of five years old was then magnetised; but it felt nothing, except the heat which it had previously contracted in playing.

These experiments were repeated by the commissioners in various ways, upon many different persons, of all ages, and with the same results, differing only according to the difference of susceptibility of the imagination of the individuals. They found effects constantly experienced, when no magnetism was used, and vice versa, (when the eyes were covered,) according to the direction of the patient's attention by questions put to him with address. Now this practice could not lead to any error; since it only deceived their imagination. For, in truth, when they were not magnetised, their only answer ought to have been, that they felt nothing.

Some facts, communicated to the commissioners by M. Sigault, an eminent physician at Paris, place the power of the imagination in a strong light. "Having announced," he says, "in a great house, that I was an adept in the art of Mesmer, I produced considerable effects upon a lady who was there. The voice and serious air which I affected, made an impression upon her, which at first attempted to conceal; but having carried my hand to the region of the heart, I found it palpitating. Her face of oppression indicated also a tightness in the chest, and several other symptoms speedily ensued: the muscles of the face were affected with convulsive twitches, and the eyes rolled; she fell down in a faint, vomited her dinner, and had afterwards several motions from the bowels, and felt herself in a state of incredible weakness and languor. A celebrated artist, who gives lessons in drawing to the children of one of our princes, complained during several days of a severe head-ache, which he mentioned to me when we met accidentally on the Pont-Royal. Having persuaded him that I was initiated in the mysteries of Mesmer, almost immediately, by means of a few gestures, I removed his pain, to his great astonishment." Dr. Sigault judiciously remarks, that it is probably by such an impression on the mind, that the light of the dentist removes the tooth-ache, when the patient has gone to him for the purpose of having his tooth drawn. He adds, that being one day in the parlour at a convent, a young lady fainted, "You go to M. Mesmer," said the nun replied, "and I can magnetise you through the grate; presenting his finger towards her at the same time. She was alarmed, grew faint, and begged him to desist; and, in fact, her emotion was so great, that had he persisted, he had no doubt that she would have been fized with a fit. Report, note p. 39-41.

But although the commissioners were convinced, by their experiments, that the imagination was capable of producing different sensations, of occasioning pain, and a sense of heat, and even actual heat, in all parts of the body; and therefore that it contributed much to the effects, which were ascribed to animal magnetism; yet the effects of the latter had been much more considerable, and the derangements of the animal economy, which excited, much more feverish. It was now, therefore, to be ascertained, whether by influencing the imagination, convulsions, or the complete effe, witnessed at the public treatment, could be produced. In proof of this point, their experiments were not left conclusive, as the following relation of one or two of them will evince. As M. Deflon acknowledged that the complete success of the experiments would depend upon the subjects of them being endowed with sufficient sensibility, he was requested to felect some of his patients, who had already proved their susceptibility of the magnetic influence, upon whom the trials might be made.

According to the principles of the magnetifiers, when a tree had been touched by them, and charged with magnetism, every person who touched the tree would feel the effects of this agent, and either fall into a swoon or into convulsions. Accordingly in Dr. Franklin's garden at Passy, an apricot tree was selected, which stood sufficiently distant from the others, and was well adapted for retaining the magnetism communicated to it. M. Deflon, having brought thither a young patient of twelve years of age, was shewn the tree, which he magnetised, while the patient remained in the house, under the observation of another person. It was wished that M. Deflon should be absent during the experiment; but he affirmed that it might fail, if he did not direct his looks and his cane towards the tree. The young man was then brought out, with a bandage over his eyes, and misleadingly
successively led to four trees, which were not magnetized, and was directed to embrace each during two minutes; M. Dellon at the same time standing at a considerable distance, and pointing his cane to the tree actually magnetized. At the first tree, the young patient, on being questioned, declared that he sweated profusely; he coughed and expectorated, and said that he felt a pain in the head; he was still about twenty-seven feet from the magnetized tree. At the second tree he found himself giddy, with the head-ache as before; he was now thirty feet from the magnetized tree. At the third, the giddiness and head-ache were much increased; he said he believed he was approaching the magnetized tree; but he was still twenty-eight feet from it. At length, when brought to the fourth tree, not magnetized, and at the distance of twenty-four feet from that which was, the crisis came on; the young man fell down in a state of insensibility, his limbs became rigid, he was carried to a grafa-plot, where M. Dellon went to his assistance, and recovered him.

This experiment, then, was altogether adverse to the principle of magnetism, not negatively, but positively and directly. If the patient, said the commissioners, had experienced no effect under the tree actually magnetized, it might have been supposed that he was not in a state of sufficient susceptibility; but he fell into the crisis under one which was not magnetized; therefore not from any external physical cause, but solely from the influence of the imagination. He knew that he was to be carried to the magnetized tree; his imagination was roused, and successively exalted, until, at the fourth tree, it had risen to the pitch necessary to bring on the crisis.

Many other experiments furnished the same results. M. Dellon was requested, from among his poor patients, those who had then the greatest sensibility to the magnetism; and he accordingly brought two women to Palfy. While he was magnetizing Dr. Franklin and several persons in another apartment, the two women were put into separate rooms. Three of the commissioners remained with one of the women, the first to question her, the second to write, and the third to represent M. Dellon, who (they perfumed her, after having bandaged her eyes) was brought into the room to magnetize her. One of them pretended to speak to M. Dellon, requesting him to begin; but nothing was done; the commissioners remained quiet, only observing the woman. In the space of three minutes, she began to feel a nervous shivering (frisson nervieux); then she felt in succession a pain in the head and in the arms, and a pricking in the hands, the became stiff, began to shake, and, with her eyes closed, she fell into a sort of insensibility, the crisis being completely characterized. Two of the commissioners were in an adjoining room with the other woman, whom they placed by the door, which was shut, with her fight at liberty, and made her believe that M. Dellon was on the other side of the door, magnetizing her. She had scarcely been seated a minute before the woman began to shiver; in one minute more she had a clattering of the teeth, but yet a general warmth over the body; and, by the end of three minutes, the crisis was complete. The breathing became hurried; she stretched out her arms behind her back, writhing them strongly, and bending the body forwards; a general tremor of the whole body came on; the clattering of the teeth was so loud as to be heard out of the room; and she bit her hand so as to leave the marks of her teeth in it.

Now, the commissioners observed, these two women were never touched, not even their pulse felt. A more clear and demonstrative proof of the power and agency of the imagination could not have been afforded them. It may be added, however, that one of these women, being sent to M. Lavoyer's, actually fell into the crisis in the antechamber, before she had seen either M. Dellon, or any of the commissioners; but she knew that she was to meet them there. While she was alone in the antechamber, a short time afterwards, different persons went to her who had no connection with magnetism, and the convulsive motions began again. They remarked to her that no one magnetized her; but so much was her imagination excited, that she replied, "If you did nothing to me I should not be in this condition." She knew in fact that she came there for the purpose of being the subject of experiment, and the approach of any one, or the least noise, attracted her attention, recalled the idea of magnetism, and produced a fresh accession of convulsions.

It is unnecessary to carry this detail of facts any farther. No experimental inquiry could have been more ably prosecuted, and no philosophical truth more clearly developed, than that the mere operation of the imagination is sufficient to produce all those great and extraordinary changes in the animal economy, which were ascribed to an hypothetical agent in nature, which was termed magnetism. If, indeed, it should be fully maintained, that the effects, produced in these isolated experiments, fell short of the phenomena occasioned at the public magnetings, there is another principle of the human constitution, which will fully account for this difference in the degree, independently of other physical circumstances necessarily existing in the latter mode of treatment; we mean the principle of imitation, as it has been termed, of which we shall say more under its proper head. (See Imitation.) Independently of the warmth and contamination of the air, in a crowded room, which particularly affects the head and the nervous system, and of the influence of music in increasing all emotions, and in addition to the multiplied impressions upon the sight and hearing, as well as those of touch and pressure, not employed in the private trials, this principle of imitation, which heightens all emotions, and augments all tendencies to action, would be sufficient to explain the difference. It was remarked that when one person fell into the crisis, the rest were speedily overcome. In like manner, we see a sort of contagion in all the imaginations and impressions excited in a crowded assembly. Hence the powerful impressions made by public spectacles, and the enthusiasm excited in theatres by generous sentiments; hence the general ardour which spreads at once through an army in the hour of battle; or, on the contrary, the universal panic which is propagated with inconceivable rapidity, often from the sight or sound of calamities, or from causes merely imaginary; and hence also the unaccountable fury of mobs. But to trace the principle to a closer analogy, all nervous and convulsive disasters are liable to propagate themselves among those who witness them, and thus to become, as it were, epidemic; whereas hysterical and epileptic convulsions have prevailed at times in large schools, manufactories, and even in religious establishments, in a most distressing manner, and were prevented only by a complete separation of the individuals, or by exciting strong counter-impressions on the mind, such as the idea of punishment, &c. (See Imitation.) The greater effects, therefore, produced at the public operations of the magnetizers, are explicable upon the known principles of the human constitution, and serve to confirm, rather than to invalidate, the inferences of the preceding investigation.

§ 2. Metallic Tractors.—Complete as the detection of the delusion of Mesmer, and the other advocates of animal magnetism, by the commissioners of Paris, was, and numerous
IMAGINATION.

as the facts were, which evinced the efficacy of touching, or even pointing at the body with the fingers, or a rod of iron, &c. in removing as well as in exciting paint and distressing sensations, it could hardly have been expected that another delusion, founded upon the same grounds, could again be diffused, after the short interval of sixteent or seventeen years, so as to find advocates among philosophical men, and to enrich the author of the contrivance. Such, however, was the fact. We now state it, rather as a matter of record than of information, that, in the year 1798, an American, of the name of Perkins, introduced into this country a method of curing diseased, for which he obtained the royal letters patent, by means of two small pieces of metal, denominated Tractors. These were applied externally near the part diseased, and moved about, gently touching the surface only; and thus multitudes of painful disorders were removed, some most speedily, and some after repeated applications of the metallic points. Pamphlets were published, announcing the wonderful cures accomplished by this simple remedy; and periodical journals and newspapers teemed with evidence of the curative powers of the tractors; inasmuch, that in the course of a few months, they were the subject of general conversation, and scarcely left general use. The religious sect of the Quakers, whose benevolence has been sometimes displayed at the expense of their sagacity, became the avowed and active friends of the tractors; and a public establishment, called the "Perkinian Institution," was formed under their auspices, for the purpose of curing the diseases of the poor, without the expense of drugs or medical advice. The transactions of this institution were published in pamphlets, in support of the extraordinary efficacy of these new instruments. In somewhat less than six years Perkins left the country, in possession, as we have been informed on good authority, of upwards of ten thousand pounds, the contributions of British credulity; and now (1811) the tractors are almost forgotten.

We by no means intend to impeach the veracity of those who attested the many extraordinary cures performed by the application of the tractors; on the contrary, we have no doubt that many of them were actually accomplished, at least temporarily; after what we have already stated, when treating of animal magnetism, (such as the fabled cure of the artift's head-ache, on the bridge, by M. Sigaud's gilded tractors,) and what we shall proceed to state respecting the effects of counterfeit tractors, it was impossible not to admit the truth and correctness of the majority of the accounts of the efficacy of Perkins's. We must observe, however, that the efficacy was founded on the delusion; and had not the scientific world been at that time in a state of comparative ignorance respecting the principle of which Galvani had recently obtained a glance; had they been in total ignorance of that principle, or poiffelled of more than that "little knowledge" of it, which "is a dangerous thing," such an imposture would scarcely have gained ground for a day, among those who were acquainted with the proceedings of the French commissioners in the affair of Meffer. But Perkins associated the idea of the Galvani principle, or animal electricity, with the operation of his tractors, by constructing them of two different metals, which the Italian philosopher had shown to be necessary to excite the operation of the agent which he had discovered: and the obscurity which hung over this subject, (for the great development of the Galvani principle by the pile of Volta, and the trough which followed, had not then taken place,) left a new field for hypothesis, and the anomalous character of the facts contributed to induce even philosophers to listen to the relation.

But Dr. Haygarth, a philosopher, to whom his profession and his country are deeply indebted for more important services (see Contagion, Fever-ward, and House of Recovery,) suspected the true source of the phenomena, produced by the tractors, from the first promulgation of the subject. Recollecting the development of the animal magnetism, he suspected to Dr. Falconer, about the end of the year 1798, when the tractors had already obtained a high reputation at Bath, even among persons of rank and understanding, that the nature of the operation of the tractors might be correctly ascertained by a pair of false tractors, resembling the real ones; and it was resolved to put the matter to the test in the general hospital of that city. They therefore contrived two wooden tractors, of nearly the same shape as the metallic, and painted to resemble them in colour. Five cases were chosen of chronic rheumatic, in the ankle, knee, wrist, and hip; one of the patients had also gouty pains. All the affected joints, except the last, were swelled, and all of them had been ill for several months.

On the 5th of January, 1799, the wooden tractors were employed. All the five patients, except one, assured us that their pain was relieved, and three much benefited by the first application of this remedy. One felt his knee warmer, and he could walk much better, as he thought with great satisfaction. One was easier for nine hours, and till he went to bed, when the pain returned. One had a tingling sensa tion for two hours. The wooden tractors were drawn over the skin in order to touch it in the slightest manner. Such is the wonderful force of the imagination.

Next day, January 9th, the true metallic tractors of Perkins were employed exactly in like manner, and with similar effects. All the patients were in some measure, but not more relieved by the second application, except one, who received no benefit from the former operation, and who was not a proper subject for the experiment, having no existing pain, but only stiffness in her ankle. They felt (as they fancied) warmth, but in no greater degree than on the former day. Of the Imagination as a Cause and as a Cure of the Disorders of the Body, exemplified by fictitious Tractors and epidemic Convulsions. By John Haygarth, M.D. F.R.S. &c. Bath, 1800.

Such were the first experiments attempted with the view of ascertaining the nature of Perkinism! But Dr. Haygarth's pamphlet contained an account of full more decisive trials made in the Bristol infirmary by Mr. Smith, one of the surgeons to that establishment. This gentleman first operated, with two leaden tractors, on Tuesday, April 19th, on a patient who had been some time in the Infirmary, "with a rheumatic affection of the shoulder, which rendered his arm perfectly useless." In the course of six minutes no other effect followed the application of these pieces of lead than a warmth upon the skin: nevertheless the patient informed Mr. Smith, on the following day, that "he had received so much benefit, that it had enabled him to lift his hand from his knee, which he had in vain several times attempted on the Monday evening, as the whole ward witnessed." But although it was thus proved that the patent tractors poiffelled no specific powers independent of simple metals, he thought it advisable to lay aside metallic points, lest the proofs might be deemed less complete. "Two pieces of wood, properly shaped and painted, were next made use of; and in order to add solemnity to the face, Mr. Barton held in his hand a flop-watch, whilst Mr. Lax mimicked the effects produced. In four minutes the man raised his hand several inches; and he had lost also the pain in his shoulder, usually experienced when attempting to lift anything. He continued to undergo the operation daily, and
and with progressive good effect; for on the 25th he could touch the mantle-piece.

"On the 27th," Mr. Smith continues, "in the presence of Dr. Lovell and Mr. J. P. Noble, two common iron nails, disguised with sealing-wax, were substituted for the pieces of malogany before used. In three minutes the name patient felt something moving from his arm to his hand; and soon after he touched the Board of Rules, which hung a foot above the fire-place. This patient at length fully recovered, that he could carry coals, &c., and use his arm sufficiently to affilt the nurse; yet previous to the use of the furious tractors, he could no more lift his hand from his knee than if a hundred weight were upon it, or a nail driven through it," as he declared in the presence of several gentlemen, whose names I shall have frequent occasion to mention. The fame of this case brought applications in abundance; indeed it must be confessed, that it was more than sufficient to act upon weak minds, and induce a belief that these pieces of wood and iron were endowed with some peculiar virtues."

See Dr. Haygarth's Pamphlet, p. 8.

Many other equally striking instances of the curative operation of the imagination, when excited by the foam of furious tractors, might be quoted from the pamphlet in question; but we shall confine our account to a cafe, which fell under our own observation. Immediately after the publication of Dr. Haygarth's exposition, the writer of this article, then a student at Edinburgh, was delirious of being convinced, by personal experience, of the truth of his fiction. Having procured two pieces of flack, painted both of a leaden colour, himself and a friend operated upon three or four individuals in various painful complaints. A servant girl, afflicted with a mortal acute head-ache, which the declared had rendered her nights altogether restless for nearly a fortnight, readily submitted to these potent electrical instruments, as we called them. We moved them about near the forehead, never touching her; and in four minutes she felt a sensation of a transient chilliness in the head; in a minute or two more she felt as if cold water was running down the temples, and the pain was somewhat diminished; but in the space of ten minutes she declared that the head-ache was entirely gone. On the following day she came to thank us for the good sleep which she had enjoyed through the night, and then continued free from head-ache; but we understood that in a few days she suffered a slight return of it. In the other cases some relief was afforded, but not so marked as in this; they were, indeed, of an inflammatory nature, and less likely to be speedily cured.

After having perused this abundant evidence of the powers of the imagination, not only in producing various affections of the body, but in removing others which exist, we can have no difficulty in crediting many relations of cures performed by persons supposing to be gifted with extraordinary powers, or employing other pretended agents, all of which may be referred to the same common principle. One of the most singular instances of this kind, both from the number of cures performed, and the rank, learning, and character of the persons to whom attested, is to be found in the person of Valentine Greatraks, who flourished in the latter part of the 17th century.

§ 53. The Cures of Valentine Greatraks, and others.—The proceedings of this pious and apparently sincere man are very interesting, as affording a history of the power of imagination and confidence in certain diviners of the body. Greatraks was the son of an Irish gentleman of good education and property, who died in his childhood. Disguised with the religious and political contentions of his country in the time of Cromwell, he retired from the world apparently in a state of melancholy derangement and bad health, which had been nearly terminated fatally. On recovering he became one of the puritans of the day, and after having acted some time in a magistrate, he had "an impulse or strange perpiration" in his mind, which continued to preoccup it, whether he was in public or in private, sleeping or waking, "that God had given him the blessing of curing the king's evil." Accordingly he commenced the practice of touching for this disease about the year 1663, which he continued for three years; at this time the ague became very epidemic, and the same impulse within him suggested, "that there was bestowed upon him the gift of curing the ague," which he also practised with success, by laying his hands on the patients. At length he found his power extended to epilepsy and paralytic disorders, &c.; but he candidly acknowledged that many were not cured by his touch. Nevertheless the unbounded confidence in his powers, and consequently the facility with which the imagination of the ignorant would be acted upon, must be manifest from the following statement, which he sent to Mr. Boyle.

"Great multitudes from divers places reported to me, that I could have no time to follow my own occasions, nor enjoy the company of my family and friends; whereupon I set three days in the week apart (from six in the morning till six at night), to lay my hands on all that came, and so continued for some months at home. But the multitudes which came daily were so great, that the neighbouring towns were not able to accommodate them: whereon, for the good of others, I left my home, and went to Youghall, where great multitudes reported to me, not only of the inhabitants, but also out of England: so that the magistrates of the town told me, that they were afraid that some of the sick people that came out of England might bring the infection into the place: whereon I retired again to my house at Affane, where (as at Youghall) I observed three days, by laying my hands on all that came, whatsoever the diseases were (and many were cured, and many were not); so that my stable, barn, and mule-hoove were filled with sick people of all diseases almost, &c." See "A Brief Account of Mr. Valentine Greatraks, and divers of the strange Cures by him lately performed. Written by himself in a Letter addressed to the Hon. Robert Boyle, esq." London, 1723, p. 32. This pamphlet was published originally in 1666.

We shall not extend this article by quoting the histories of cures certified by several physicians, as well as by divines and philosophers; among whom were the names of Robert Boyle, Dr. Cadworth, Dr. Whichcot, &c. We may remark, that some of the cures of head-ache appear to be described with great fidelity, as people appearing to be cured by the furious tractors above-mentioned; and that the hand of Greatraks can only be conceived to have operated in the same way. The influence of the imagination was likewise obvious in several convulsive affections; in the same manner as in the women at Pafl-y, who fell into the cribs before the magnetin was applied. Greatraks mentions several poor people that went from England to him, "and amongst the rest, two that had the falling-sicknefs, who had never been free, till they fell into their fits immediately;" and he restored them, he affirms, by putting his hands upon them. (Loc. cit. p. 34.) Nay, he tells us, that even the touch of his glove had driven many kinds of pains away (p. 30), and removed strange fits in women (p. 32); and that the thraling of his hand or his glove had, in his opinion, and that of other persons present, driven several devils or evil spirits, out of a woman, one after the other, "every one of whom had been born like to choke her (when it came up to her throat), before it went forth." Now, this whole description contains a pretty accurate
accurate picture of an ordinary hysterical fit, with its attendant gloom, terminating with the discharge of flatus. P. 31.

About the same period, a Capuchin friar, whose name was Francisco Bagnone, was famous in Italy for the same gift of healing, by the touch of the hands only; and was attended wherever he went by great multitudes of sick people, upon whom he operated numerous and surprising cures, which were deemed true miracles. So general was the belief in his curative powers, that even a prince of Parma, who had laboured under a feverish disease for the space of six months, was induced to apply to him, and was immediately cured by his voice only. The prince himself, and many others that were present, afterwards bore public testimony to the fact. It appears, however, as might be anticipated, and as Greatrakes honestly acknowledges with respect to his own attempts, that great numbers of persons, who applied to the friar with full faith in his powers, were not benefited. A celebrated Venetian physician, Tacchecinis, affirms that it was notorious, that many (etiam plurimos) of the sick left his presence as feble and wretched as when they were admitted: "et ita abibisse, ut admissi erant, miseros atque imbecilles, et vidi ipsi et vulgo conflat." It is curious to observe, how the same discoussions and the same arguments are repeated in different ages, when the same subject is agitated. Tacchecinis says, that many persons, especially of the higher classes, afflicted the whole of the affair to the imagination: but to this it was replied, that children, wrapped in their swaddling clothes, were cured through the faith of their parents. Nevertheless, he says, he saw some children brought to the monk several times, who were carried home as sickly as they went. Yet he confesses himself unable to make up his opinion respecting so occult a matter, which is maintained and disputed by so many people. It will be recollected, that the friends of Perkins maintained, in answer to Dr. Haygarth's observations, that sheep and horses had been cured by the metallic tractors, and therefore the influence of imagination was out of the question.

Pechlin, a celebrated Danish physician, to whom the above stated facts were communicated, and who referred them exclusively to the imagination, mentions another perfon, of the name of Marcus Avianus, a man of aududc manners, and bearing a high reputation for facility, who obtained a great fame, with a certain class of credulous people, for the cure of diseases in this way. It is certain, however, he adds, that all his efforts were not equally successful; and many, who were apparently cured, speedily relapsed. See Jo. Nic. Pechlini Observ. Phytoco-Medic. lib. iii. Obs. xxxii.

But it is unnecessary to enumerate the individuals, the De Mainades, the Preftos, &c. who have at different times been distinguished by the possession of various occult methods of healing the sick. The practice has occasionally prevailed in almost all ages; and we have seen, in the detail of experiments above related, that the faculty of the imagination, in certain habit and condition of the body, and especially in the irritable female constitution, is actually capable of producing all those effects on the corporeal frame, which have been deemed the refult of occult agency and extraordinary powers.

§ 4. Effects of Magic, Incantations, Amulets, Holy Relics, &c. — Admitting this, then, as an established principle of the human constitution, and making due allowance for the exaggerations and misrepresentations of ignorance and superflition, we are enabled to give a rational explanation of many historical relations, which have been considered as altogether fabulous, or as direct violations of truth. We are well aware of the facility with which the imagination is excited in an uninformed person, and more particularly in an age of profound ignorance, which is, for that reason, commonly an age of superstitious. We know, too, that in the middle ages, when every form of science was almost unknown, and the laws of nature had not been investigated, the smallest discovery in natural philosophy, chemistry, or astronomy, was deemed the result of supernatural communication with the world of spirits; and the discoverer or possessor of the knowledge was looked upon as a being gifted with supernatural powers. In such a state of the human mind, when natural philosophy, magic as it was, was dignified with the name, and clothed with all the apocrific accessories of magic; and when every person, with a little more knowledge than his neighbours, was master of so many magics, so many tractors, by which he could rule the imaginations of the multitude; it cannot be the subject of our wonder, that the magician's rod (or the philosopher's cane) should produce such mighty operations, or that a seraph of his writing should be a remedy for many maladies. These only executed what was afterwards performed by M. Defjon's extended fingers, and Valentine Greatrake's glove! The effects, then, of the incantations, amulets, and all the arts of magic, witchcraft, and astrology, by which the more artful pretenders to superior knowledge imposed upon the people, may be allowed to have actually occurred, and to have been the result of natural causes; and they are plainly referrible to one common source, with those of animal magnetism, Perkinism, and various other modifications of the imagination in fetters.

It is scarcely necessary to add, that, during the same periods of ignorance and superstition, those extremely pious and comparatively learned persons, who have been enrolled in the catalogue of saints, must necessarily have obtained the most complete veneration and confidence from the multitude; and hence, after their death, every relic of their bodies or clothing, the fringes in which they were entombed, fragments of the instruments of their execution (in the cafes of martyrdom), and every other object that could excite, by affection, those reverential feelings, usually called up by a contemplation of their character, would become so many agents upon the imagination, by which all the extraordinary changes in the animal economy above described might be effectually produced. Thus we cannot doubt that there is much foundation for the histories of recovery from various diseases, occasioned by removing the skin to the teeths of celebrated worthies, or placing them before the statues and images of these persons, or by touching them with nails taken from the coffins, or rings from the fingers, or the bones of the fingers themselves of these saints, or by the influence of an infinity of relics of this sort, which cannot be supposed to possess any power over a superlative mind, than the painted tractors of a surgeon, or the glove of an enthusiast.

§ 5. Influence of the Imagination in Aid of Medicine. — Since it is obvious, then, that the imagination is capable of producing very important changes in the nervous and vascular systems, independently of the operation of medicine; the physician will infer, that this faculty may be employed as a powerful adjuvant in his hands, and that, by a combination of the most active remedies of both body and mind, he may extend the usefulness of his art to the utmost bounds. A very able physician, Dr. Lind of Haflar, long ago deduced this inference from an interesting occurrence at Breda, related by Vander Myse. "An important leaffon in physic," he says, * is here to be learned, namely, the wonderful and powerful influence of the passions of the mind upon the state
and disorders of the body. This is too often overlooked in the cure of diseases; many of which are sometimes attempted by the sole mechanical operation of drugs, without calling into assistance the strong powers of imagination, or the concurring influences of the soul. Hence it is, that the same remedy will not produce the like effect, even in the same person, when given by different hands." (See Lind's Treatise on Scirpus, 3.) The history given by Vander Mye is strongly illustrative of the subject before us.

During the siege of Breda, in 1625, the garrison was afflicted with the febrity in a most dreadful degree. "When the prince of Orange heard of their distress," says this physician, and understood that the city was in danger of being delivered up to the enemy by the soldiers; he wrote letters addressed to the men, promising them the most speedy relief. These were accompanied with medicines against the febrity, said to be of great price, but of full greater efficacy; many more were yet to be sent them. The effects of this deceit were truly astonishing! Three small phials of medicine were given to each physician, not enough for the recovery of two patients. It was publicly given out, that three or four drops were sufficient to impart a healing virtue to a gallon of liquor. We now displayed our wonder-working phials; nor were we even the commanders left into the secret of the elixir put upon the soldiers. They flocked in crowds about us; every one soliciting that part may be referred for their use. Cheerfulness again appears on every countenance, and an universal faith prevails in the sovereign virtues of the remedies. The herbs now begin to spring up above the ground, of these we make decoctions, to which wormwood and camphor were added, that by the prevalent flavour of these, they might appear medicines of no mean efficacy. The stiff contracted limbs were anointed with wax, melted in rapeseed or linseed oil. The invention of new and untried phytic is boasted; and amidst a defect of every necessary and useful medicine, a strange medley of drugs was compounded. The effect, however, of the delusion was really astonishing; for many were quickly and perfectly recovered. Such as had not moved their limbs for a month before, were seen walking the streets, straight, and whole. They boasted of their cure by the gentle remission of the motion of their joints being relieved by a simple friction with oil, and the belly now of itself well performing its office, or at least with a small affliction from medicine. Many who declared they had been rendered worse by all former remedies, recovered in a few days to their inexplicable joy, and the no less general surprise by taking (almost by having been brought to them) what we affirmed to them to be their gracious prince's cure." Lind's loc. cit. and Fred. Vander Mye, de morbis et symptomatibus popularibus Bredanisi, tempore obiditionis.

Another rule of medical practice is to be deduced, Dr. Haygarth observes, from the facts which were ascertained from the experiments with the fictitious tractors. "A patient ought always to be inspirited in the belt manner possible, with confidence in any remedy which is administered: but if a favourable opinion of it cannot be obtained, and especially if there be a marked prejudice against it, another (though a less powerful) medicine ought to be preferred." Haygarth, loc. cit. p. 28.

The preceding statements illustrate also the great advantages of medical reputation, in consequence of the faith of the sick in the medicines prescribed by those who are professed of it. This explains what has been frequently observed, that the same remedy will produce more beneficial effects, when prescribed by a famous physician, or an aspiring empiric, than when taken from the hands of a person of less character and notoriety. Magnificent and unqualified promises, in the latter case, inspire weak minds with implicit confidence. "Omne ignotum pro magno!"

Upon this principle we may account for the marvelous recoveries frequently ascribed to empirical remedies, which are often inert drugs, and generally applied by the ignorant patient in disorders totally different from what the quack himself pretends that he can cure. Hence also it may be observed, that new medicines, even when their composition is known, if recommended to the public with exalted praise, have sometimes been attended with great success much greater than future experience confirmed. From the same views it is apparent, why reputation, however absurdly obtained, will contribute to enable certain physicians to do some diseases. Thus kings, old women, and children, who have had medical diplomas assigned to them by common confound for many ages, have probably sometimes worked cures. Nevertheless, we have seen, that there were other attractions to the preference of kings, besides the royal touch, when that was in vogue; and the angel was perhaps the best ingredient in the remedy. See Evil, King's.

After all that has been said, some characters may probably be sceptical as to the power of the imagination over the corporeal organs, illustrated in this article; and think it impossible that such great physical changes can be produced by a mere mental affection. How, they will ask, can any operation of mind at once modify the actions of vessels, nerves, and muscles, over which the will has no control? Nothing is more mysterious or inscrutable than the operations of the mind upon the body; so that the proximate cause of the motion of the muscles of any organ, by a thought, a volition of the mind, is altogether incomprehensible. The only answer, therefore, that can be given to this question, consists in shewing that analogous effects of the operation of the mind in regard to organs not subject to the will are frequent in the animal economy.

We have a familiar example of the instantaneous change in the action of blood-vessels, occasioned by an affection of the mind in the act of phlegm, in which the cutaneous vessels of the face are immediately dilated with blood, from the feeling of shame; and a full greater dilation of vessels occurs in some other organs of the body, as the immediate consequence of certain passions. On the contrary, other mental emotions, such as fear and terror, as speedily diminish the action of the blood-vessels; whence the sudden paleness which overflows the persons under such emotions; nay, when these are violent, the whole system of circulation, heart and arteries together, is often instantaneously suspended in its motions; if this suspension be merely temporary, as it usual, syncope or fainting only occurs; if it be permanent, which has sometimes happened, death ensues. In delicate and irritable habits, and therefore especially in the female sex, very slight affections of the mind will produce convulsions, and all the other effects which were exhibited in the crises of animal magnetism. Hypertonic paroxysms are thus frequently produced by the mimic pathos of a theatrical scene; by the lightened emotions of alarm and apprehension; and even by joy; and they often ensue after a continued attention to some interesting object. Even the convulsions of epilepsy have been excited by the mere sight of a perfum affliction by them. (See Imitation.) In fact, the mind has an extensive influence over epiphanic and convulsive diseases, which depend chiefly upon the unusual mobility of the nervous system, from the slight convulsion of hiccough to the most violent hypnotical fit; and as the motions of the heart and arteries are closely connected with the state of the brain and nerves, through the same medium the force, rapidl,
dity, and regularity of the circulation may be variously affected. It would seem, indeed, that by a continued direction of the attention to particular parts of the body, combined with a belief in the efficacy of a supposcd remedy applied to them, the action of particular portions of the circulating system may be considerably modified. For not only has this effect arisen from the external employment of the *trials*; but even the internal organs, e.g. the stomach and bowels, have been acted upon by medicines of supposcd efficacy which had been swallowed. There are instances on record of bread *pills* operating as purgatives, when administered with the assurance that they would produce that effect: and it is well known, that not only the sight of a person in the act of vomiting, but even the thought or recollection of it, has produced the inverted action of the fibres of the stomach, and vomiting itself. Turner mentions a young gentleman who was a patient of his, and who having taken several draughts emetics, became so distressed, that he could vomit by the force of imagination as effectually as from the most active medicine. The sight of a bolus produced this effect immediately, again and again, whenever it was produced. "Nay, so great and admirable," says Turner, "is the idiosyncrasy of this gentleman, that if at meals or in company, though never so well before, other persons talked but of a bolus, or himself casually thought upon the same, it was odd if he was not forced to rise from table and fall a vomiting." Turner on Diseases of the Skin, chap. xii. See also Pechlin. Obs. Med. Phys. the third book of which relates chiefly to the influence of the mind on the body; and Whytt on Nervous Disorders, chap. v. sect. 6.

On the whole, then, there is ample evidence of the influence of the mind over the actions of the nervous and muscular parts of the body, which are not under the subjection of the will; and therefore we have the concurring proofs, both from analogy and direct experiment, in favour of referring all the phenomena comprehended in this article, to one and the same principle. See also IMITATION.

IMAGINATION, in *Music*, was too much fettered during the seventeenth century by canon, fugue, and ecclesiastical modes, to attempt the use of her wings. In the perusal of the music of the times, we collected fragments of the infant lip in the vocal language, which has been finer so highly polished; but neither found in the subjects of fugue, or vocal divisions, anything like invention or grace, till after the time of Carullini and Stradelli, who seem to have been the first gifted musicians in Italy. In England, crowded and elaborate as is the harmony, and smooth and antiquated the melody in the collection of the best compositions of the time, in queen Elizabeth's virginal book, there is a manifest superiority in those of Bird over all the rest, both in texture and design. In a later age his genius would have expanded in works of invention, taste, and elegance; but, at the period in which he flourished, nothing seems to have been thought necessary for keyed-instruments, except variations to old tunes, in which all the harmony was crowded, which the fingers could grasp, and all the rapid divisions of the times, which they could execute. Even nominal fancies were without fancy, and confined to the repetition of a few dry and unmeaning notes in fugue, or imitation. Invention was fo young and feeble, as to be unable to go alone; and old chassis of the church, or tunes of the street, were its leading-strings and guide.

IMAGINIFER, among the Romans, an ensign-bearer, who carried the standard on which was represented the image of the reigning emperor. See *SIGNA*.

IMAGLIN, in *Geography*, a small island in the Straits, between the western coast of America, and the east point of Russia. N. lat. 65° 40'; E. long. 159° 44'.

IMAGO, in *Natural History*, is a name given by Linnaeus to the third state of insects, when they appear in their proper shape and colours, and undergo no more transformation.

IMALGAN, in *Geography*, a small island in the sea of Mindoro. N. lat. 10° 51'; E. long. 121° 5'.

IMAM, or *Imam*, a minister in the Mahometan church, answering to a parish priest among us.

The word properly signifies what we call a preacher, *anijfer*, one who preaches over others; but the Mussulmen frequently apply it to a person who has the care and tendancy of a mosque, who is always there at first, and reads prayers to the people, which they repeat after him.

IMAM is also applied, by way of excellence, to the four chief or founders of the four principal sects in the Mahometan religion.

Thus *Ali* is the Imam of the Perilans, or of the sect of the Schites; *Abu-beker* the Imam of the Sunnites, which is the sect followed by the Turks; *Sapphi*, or *Safi-ya*, the Imam of another sect, &c.

The Mahometsans do not agree among themselves about this *imamate*, or dignity of the Imam. Some think it of divine right, and attached to a single family, as the pontificate of Aaron. Others hold, that it is, indeed, of divine right, but deny it to be so attached to any single family, as that it may not be transferred to another. They add, that the Imam is to be clear of all gross faults; and that otherwise he may be depayed, and his dignity may be conferred on another. However this be, it is certain, that after an Imam has once been owned as such by the Mussulmen, he who denies that his authority comes immediately from God, is accounted impious; he who does not obey him, is a rebel; and he who pretends to contradict what he says, is esteemed a fool, among the orthodox of that religion. The imams have no outward mark of distinction; their habit is the same with that of the Turks in common, except that the turban is a little larger, and folded somewhata differently.

IMAM of Sana. See *SANA* and YEMEN.

IMAMLA, a name given to that sect of the Mahometans, to which the Perilans adhere. See *IMAN*.

IMANDRA, a considerable lake of Russian Lapland.

IMAUS, in *Ancient Geography*, part of a long chain of mountains, which traversed Independent and Russian Tartary, with the extent and direction of which the ancients were very imperfectly acquainted. According to them, this chain divided Scythia into two parts, e.g. Scythia intra Immus and Scythia extra Immus. Ptolemy not only describes the Immus or insular Mount N. and S., which is the Behar-Tagh of the Russians and Tartars, with its ridges to the W., now called Argun, Ak-tau, &c.; but another Immus passing E. and W. to the N. of Hindoostan. As the Northern Imus of Ptolemy is clearly the Behar-Tagh, so his Southern Imus may be safely regarded, says Pinckerton, as the Himalchel of the Hindoos; which we may allow to have been known to the ancients, who were no strangers to the rich Gangetic regions of Hindoostan. Nor was it absurd to consider the Himalchel as a S.E. prolongation of the Northern Imus. See *HIMALCHI*. 

*IMA*. 4 Y 2
IMBA, in Geography, a town of Japan, in the island of Niphon; 70 miles E. of Jedo.

IMBANKING. See Banking.

IMBARGO, or Embargo, a stop or stay put upon ships, or merchandise, usually by public authority. See Embargo.

IMBATTLED. See Embattled.

IMBECILITY, a state of languid and decay; wherein the body is not able to perform its usual exercises or functions.

IMBER, in Ornithology. See Columbus Imper.

IMBEZLE, or Imbezzle, is probably from the old English word to waife, pilfer, or purloin.

As where a person intruded with goods, wares, consumes, and diminishes them, he is said to imbezzle them. Persons that imbezzle, or illegally dispose of any woollen, linen, flaxen, cotton, or iron materials; or gloves, leather, shoes, &c., with which they are entrusted for manufacture, shall forfeit double the value, or be sent to the house of correction, and there whipped, and kept to hard labour fourteen days: and for the second offence, forfeit four times the value, &c.

Buyers and receivers are liable to the same penalties, 13 Geo. II. c. 8.

If any servant imbezzles, purloins, or makes away his master's goods, to forty shillings value, it is made felony without benefit of clergy, 12 Ann. c. 7. Imbezzling the king's armour, or arms, is felony by 31 Eliz. c. 4; other inferior imbezzlements and misdemeanours of the same kind are punished with fine, corporal punishment, and imprisonments, by 9 & 10 Will. III. c. 41; 1 Geo. I. c. 25; 9 Geo. I. c. 8, and 17 Geo. II. c. 55. The usual method of proceeding against high officers who imbezzle the public money is by impeachment in parliament. At common law the offender is subject to a discretion, a fine and imprisonment.

Imbezzling, or vacating records, is a felony of offense against public justice, 8 H. VI. c. 12.

IMBIBE, is commonly used in the same sense as absorb, viz. where a dry porous body takes upon itself that which is moist.

IMLOCATION, in Middle Age Writers, a particular method of dispersing the dead bodies of excommunicated persons, by raising them over a heap of flames, or earth. This was done in the fields, or near highways; that being unlawful to bury them in holy ground, or even to inter them at all. See BURIAL.

The word is derived from the, tumulus.

IMBRA CHRISTUS, in Geography, a town of Abyssinia; 145 miles S.E. of Gondar.

IMBRICARIA, in Botany, was so named by Dr. Smith in his paper on the "Botanical Characters of some Plants of the Natural Order of Mystici." Linn. Soc. Trans. v. 3. 257. This is the Jungia of Gartner, but Linnaeus in his Supplementum Plantarum having already dedicated a plant, of a very different genus, to the memory of Jungius, it became necessary to give this of Gartner another denomination. Professor Gmelin called it Mollus, but that was of uncertain derivation it was purposely changed. In preference; therefore, to Mollus (says Dr. Smith), this genus is called Imbricaria in allusion to its imbricated foliage. A farther reason for my choice of this name is to distinguish the Imbricaria of Gmelin, taken up by him from Jullien, which I knew from original specimens to be the identical Mimifops Kauki of Linnaeus, of which Jullien, after Convers' Manuscripts, made a distinct genus on account of its fruit having eight cells, and as many seeds; but Convers observed that four or more of these were often abortive; and on the other hand Rumphius tells us the Mimifops has often as many as three or four perfect seeds. It is probable, therefore, that the genus has eight cells and eight seeds, most of which are generally abortive; a striking instance of the necessity of studying that part in all its states.

Elf. Ch. Petals five. Stigma capitate. Capsule covered by the calyx, of two cells and many seeds.

1. I. cresulata. Linn. Soc. Trans. v. 3. 259. (Jungia sabulata; Gartzn.) "Leaves obovate-wedge shaped, crenulated towards the top. Petals and calyx toothed." A native of Port Jackson, New South Wales. — Stem about a foot high, tough and wiry, thickly imbricated with smooth, shining, carinate leaves. Flowers lateral. Whole plant smooth.

There are the only species known; but it has been sur- guessed that the Jungia tenella of Gartner might be added to this genus. This last mentioned author suspected the Ecolonia of Linn. Suppl. to be the same as his Jungia, but these genera differ essentially in the latter having a capsule instead of a berry, not to mention other particulars.

IMBRICATED, is used, by some botanists, to express the figure of the leaves of some plants, which are hollowed like an imbric, or gutter-tile, or are laid in close series over one another like the tiles of a houle.

IMBRICATE Cupid, imbricatus calyx; a term used by authors to express the cups of some of the plants which have compound flowers, in which the common perianthium, surrounding the whole cluster of flowers, is composed of several series of squamae, the exterior of which is short, and the interior longer, but in great part hid under these upper ones.

IMBRICATED Shell, imbricata concha, in Natural History, a term used in general to express any species of shell-fish, whose shells are elevated into transversc ridges, lying over another at the base, in the manner of the tiles on a houle-top. It has also been used as the name of a peculiar species of shell; this is a cordiformes, or heart-shell, whose fides are remarkably ridged in this transversc manner, and at the same time fo divided longitudinally by lew high ribs running from the apex to the edge, that the whole represents the roof of a houle with the beams and rafters, before they are covered by the tiling. Hence the French call it fitters.

IMBRO, in Geography, an island in the Grecian Archipelago, mountainous and woody, with plenty of game; about 30 miles in circumference and containing five villages, two of which are defended by cattles. N. lat. 40° 10'. E. long. 25° 46'.

IMELBORN, a town of Germany, in the county of Henneberg; 34 miles S.E. of Salzungen.

IMER, in Geography, a female opera singer in London 1746, at the same time as Monticelli. Though she was nominally the first woman, the never surpassed mediocrity in voice, taille, or action.

IMGAUÉL,
IMGNIEL, in Geography, a town of Norway, in the diocese of Drontheim; 76 miles N.N.E. of Runsfild.

IMHOFF, JOHN WILLIAM, in Biography, an eminent genealogist, was a German of a noble family, who devoted himself to the study of history, politics, and particularly the defects and alliances of all the great houses in Europe. His principal works are "De Notitia Procerum Germaniae." "Historia Genealogica Italica et Hispania." "Familiae Italica, Hispanica, Portugalliae, Magnae Britanniae, cum Addenda." "Recherches fur les Grands d'Epagne." He died in 1758.

IMIDSU, in Geography, a town of Japan, in the island of Niigata, 37 miles W. of Jedo.

IMUMRETTA, IMERITA, or IMERETIA, a country of Asia, in European Turkey, which lies between the Caspian and Black seas, bounded on the E. and S. by Georgia, on the N. by Olfitia, or that part of Circassia, called the government of Caucasia, on the W. by Mingrelia, and on the S. by Turkish Armenia. It pertains to the ancient Iberia, and is about 80 miles from N. to S., and nearly as much from E. to W. The country is mountainous and poor; and the inhabitants are wanderers and vagabonds. Although it could formerly supply an army of 25,000 men, it is now thinly peopled, on account of the number of children purchased by the Turks, and an impost laid upon them of furnishing annually 80 young men, between 10 and 20 years of age. The governing prince assumes the title of king of kings. The towns are few; but the principal seems to be Cotatis.

IMITATION, in the Arts of Design, has, as in other things, two acceptations; one of a confined, the other of a more vague sense. In the first it signifies merely copying closely the forms or colours of a work of art or nature; in the second, it is sufficient that the style of the thing imitated be maintained; and in this latter sense most frequently applied. Thus Raphael may be said to have imitated in his latter works the style of Michael-Angelo in design; and Julio Romano his master Raphael. Thus the whole Venetian school endeavoured to imitate Titian and Paul Veronese; and the Flemish Rubens, Rembrandt, and Teniers.

Imitation, thus considered, is the true source of advancement in art. Were it not for the attempt to follow in the paths of great men, the arts would be always in their infancy; be always stultifying in their progress, if we may use the expression; and therefore shall we appreciate a long continuance of doll copying the effects and defects of the greatest masters, we would recommend to all youths engaged in the polite arts, at all times to keep in their mind's-eye at least, the works of those who have successfully passed the ordeal of time; and most probably if they have original genius within them, its fire will be most usefully elicited by rivalry thus ludicrously excited. And not to youths alone will this conduct be found useful; right happy ought he to feel himself, who, adopting this plan, shall become able to unite the various beauties he may thus felect.

Too much stress has been laid upon what is termed originality, to which title it would appear eccentricity has the forest claim. But that is not the foundation upon which the great artists of Italy, Spain, and Flanders, proceeded in their labours. Step by step they advanced upon the merits of their predecessors; till at last their own excellencies seem to leave little room for further advance in true taste: yet that mode of study which has produced so much, bids most fair to produce whatever may best be effected in art: viz., a careful imitation in the first instance of what has been done, till the mind is informed of the most important principles of art: and then a judicious examination, how far these works correspond with nature; and wherein they are capable of receiving new beauties, consistent with the laws and principles by which the one is governed. How far positive imitation of nature is, in painting or sculpture required by, or consistent with the best principles of those arts, see the article IDEAL, in Painting and Sculpture.

IMITATION may here be considered as one of the sources of pleasure to Taste. Accordingly it gives rise to what Mr. Addison terms the secondary pleasures of imagination, which form, without doubt, a very extensive class. For all imitation affords some pleasure; not only the imitation of beautiful or great objects, by recalling the original idea of beauty or grandeur, which such objects themselves exhibited; but even objects, which have neither beauty nor grandeur, may, for which which are terrible or deformed, please us in a secondary or represented view. The high power, says Dr. Blair, which eloquence and poetry possess, of supplying taste and imagination with such a wide circle of pleasures, they derive altogether from the things having a greater capacity of imitation and description than is possessed by any other art. Of all the means which human ingenuity has contrived for recalling the images of real objects, and awakenings, by representation, similar emotions to those which are raised by the original, none is so full and extensive as that which is executed by words and writing. By the affluence of this happy invention, there is nothing, either in the natural or moral world, but what can be represented and set before the mind, in colours very lively and real. Hence it is usual among critical writers, to speak of discourse as the chief of all the imitative or mimetic arts, they compare it with painting and with sculpture, and in many respects prefer it juicly before them. However, neither discourse in general, nor poetry in particular, can be called altogether imitative arts. We must distinguish, says Dr. Blair, betwixt imitation and description, which are ideas that ought not to be confounded. Imitation is performed by means of somewhat that has a natural likeness and resemblance to the thing imitated, and of consequence is understood by all; such are statues and pictures. Description, again, is the raising in the mind the conception of an object by means of some arbitrary or instituted symbols, understood only by those who agree in the institution of them; such are words and writing. Words have no natural resemblance to the ideas or objects when they are conceived in the mind; but a figure or a picture has a natural likeness to the original. And therefore imitation and description differ considerably in their nature from each other. Nevertheless imitation and description agree in their principal effect, of recalling, by external signs, the ideas of things which we do not see. But though in this they coincide, it should not be forgotten, that the terms themselves are not synonymous, that they impart different means of effecting the same end; and of course make different impressions on the mind. Blair's Lect. vol. iii. See POETRY.

IMITATION, in Muses, dramatic or theatrical, belongs to imitation, as much as poetry and painting do; in this instance it is a principle common to all arts. But this imitation does not belong to all arts to the same extent. All that the imagination can convey to the mind belongs to poetry. Painting, which cannot present its pictures to the imagination, but to sense, and to one sense only, can only paint objects submitted to the judgment of the eye. Music should seem to have the same bounds with respect to the ear; however, she can represent every thing, even objects that are only visible: by an illusion almost inconceivable, she seems to put the eye into the ear; and the greatest miracle of an art, which totally depends on movement, is, that it can excite an idea of repose. Night, sleep, solitude, and
IMITATION.

and silence; all ensmmbled among the great pictures of music. It is known that noise can produce the effect of silence, and silence the effect of noise: as when we fall asleep during an even-toned and monotonous reading, and that we wake the instant it ceases. But music acts more immediately upon our sensation in exciting by one sense familiar affections to those which we can excite by another. And, as the relations cannot be sensibly united unless the impression is forcibly made, painting, stripped of this force, cannot return to music those imitations which music draws from her ideal painting. Let all nature sleep, the person who contemplates her at such a time is not asleep. And the musician's art consists in substituting to the inefhblable object that of movement, which its presence excites in the heart of the beholder. It will not only agitate the fee, increase the flames of a conflagration, render the stream of a river more rapid, produce showers, and twelv torrents; but will paint the horror of a frightful desert, blacken the walls of a subterraneous dungeon, calm the tempers, render the air tranquil and serene, and fled from the orchestra new features on the grove. It will not represent these things directly; but it will awaken in the mind the same sensations which we feel in seeing them.

It has been said in the article Harmony, that we can draw from it no principle of musical imitation, as there is no relation between chords and objects which we wish to point, or passions which we would express. See Melody.

IMITATION, in its technical sense, is using the same, or a familiar passage or melody, in many different parts, which are heard one after the other: in the unison, 5th, 4th, 3d, or in any other interval whatever. Imitation is always pleasing, even if many notes are changed, provided the air is not so disguised as to be no longer recognizable, and the rules of modulation are not violated. Often, in order to render imitation more perceptible, it is preceded by a ref, or by long notes, which seem to extinguish the melody at the very moment when it is renewed by the imitation. Imitations are warrable at our pleasure; they are confined to no particular intervals, they may be continued or changed for another, or the imitation made in modo contrario, or contrary motion, or in what way we please. The several performers like it better than a dull and dry accomplishment: it renders a part more amusing to the player and important to the hearer; the rules are as relaxed as those of fugue are rigid; for which reason great masters disdain imitations from the facility with which they are composed; and when purvey too closely with the manifest ambition of being particularly noticed, they discover the young contrapuntist. Rouelli.

IMITATION, Principle of; in Medicine. Man was characterized by Aristotle as an imitative animal; and a propensity to imitation appears from the first dawn of reason in infants, and in some measure accompanies us through life. By this term, we do not mean to designate that voluntary and deliberate imitation, by which we copy the drees, language, or manners of others; but that sort of imitative imitation, (to adopt the language of Dr. Darwin,) of which we are almost unconscious, and to which we are drawn mechanically, as it were, by a propensity, which it requires an act of volition to resist;—"this imitation machinale, qui nous porte malgré nous à répéter ce qui frappe nos sens," as the French commissioners have expressed it. (Rapport des Commissaires chargés par le Roi de l'Examen du Magnétisme Animal, p 77; Paris 1784.) The most familiar example of this propensity that can be adduced, is the act of yawning, which is readily propagated from one person through a whole company. But there is scarcely any irregular action of any organ of the body, which has not been taught (to use a common phrase), in consequence of this tendency to imitation, by different individuals: thus painting, hammering, wink ing with the eyes, and various unseemly habits, have been frequently acquired, by associating with those to whom they were already habitual. In a similar manner, many people are immediately excited to the act of vomiting by the sight of a person in the same act; and various convulsive disorders have been excited by looking on others affected with them. Baglivi mentions a young man, who, looking at a person in an epileptic fit, was himself affected in the same manner; and Dr. Whytt says, "it has frequently happened in the Royal Infirmary here (at Edinburgh), that women have been seized with hydrid fits, from seeing others attacked with them." A fact, which the writer of this article has also witnessed in the same hospital.

A remarkable example of this infectious nature of convulsive diseases, (if the term may be used in this sense,) occurred in the poor's house at Haerlem, under the inspection of the learned Dr. Boerhaave, of which his nephew has given the following account. "In the house of charity at Haerlem, a girl, under an impression of terror, fell into a convulsive fit, which returned in regular paroxysms. One of the bystanders, intent upon afflicting her, was seized with a fit, which also occurred at intervals; and on the day following, another was attacked; and a fourth; in short, almost the whole of the children, both girls and boys, were affected with these convulsions. No sooner was one seized, than the fight brought on the paroxysm in almost all the rest at the same time. Under these distressing circumstances, the physicians exhibited all the powerful antiepileptic medicines with which their art furnished them; but in vain. They then applied to Boerhaave, who, compassionating the wretched condition of the poor children, repaired to Haerlem; and whilst he was inquiring into the matter, one of them was seized with a fit, and immediately he saw several others attacked with a species of epileptic convulsion. It presently occurred to this sagacious physician, that, as the best medicines had been feicly administered, and as the propagation of the disease from one to another appeared to depend on the imagination, (or the principle of imitation,) by preventing this impression upon the mind, the disease might be cured. To this end his resolution was successfully adopted. Having previously applied the magistrates of his views, he ordered, in the presence of all the children, that several portable furnaces should be placed in different parts of the chamber, containing burning coals, and that irons, bent to a certain form, should be placed in the furnaces; and then he gave these farther commands:—that all medicines would be totally useless, and the only remedy with which he was acquainted, was, that the first who should be seized with a fit, whether boy or girl, must be burnt in the arms to the very bone, by a red-hot iron. He spoke this with uncommon dignity and gravity; and the children, terrified at the thoughts of this cruel remedy, when they perceived any tendency to the recurrence of the paroxysm, immediately expelled all their strength of mind, and called up the horrible idea of the burning, and were thus enabled, by the stronger mental impression, to refit the influence of the morbid propensity." (Abr. Kau-Boerhaave, Impet. faciens; Hippoc. dictum, ix. § 486.) This case affords at once an illustration of the powerful operation of the imitative principle, and of the influence of the imagination, when excited by strong impressions, over the diseases of the body, as related in a preceding article. See Imagination.

If we trace the operation of this imitative propensity a little farther, we find that convulsive disorders are not only communicated, in this manner, to persons who live in the same
fame house or apartment; but that they have, in many in-
stances, been propagated from house to house, by the inti-
mate intercourse of persons in the same neighbourhood, and
thus a sort of epidemical convulsions has been produced.
At the latter end of the year 1796, Dr. Haygarth was fully
reflecting on a convulsive malady, which prevailed for some time
among the tenants of the earl of Ulster and Holland
Griffith, esquire, in the island of Anglesey. This disease
gradually spread from one girl to twenty-three others, all
between the age of ten and twenty-five; except one boy,
seventeen years old, all the patients were females. This
disorder began with pain in the head, and sometimes in the
flank and sides, but not very violent; this was succeeded by
violent twitchings or convulsions of the upper extremi-
ties, continuing with little intermission, and causing the
shoulders almost to meet by the exertion. The second
person attacked was that of the third, and lived in the same
house; the third and fourth were acquaintances, and had
been much alarmed at fecling the fits of the first patient.
In the course of two or three months, eighteen girls were thus
attacked, of whom only two had recovered.
The influence of the imagination, as well as of the principle of
imitation, was obvious from the general alarm and anxiety pre-
valing; a state of mind which predisposes to the operation of
this principle, as was exemplified by the animal-mag-
netism. (See Imagination.) "All of them," says Mr.
Griffith, "as far as I can understand, were taken much in
the same manner with the first three. Their lower extre-
mities are free from pangs, although they fix themselves
considerably relaxed. The least alarm throws them into a
shaking fit. They have in general a hiccup. The anxiety
of parents, fathers, brothers, friends, &c. for their recovery,
is particularly obvious in this neighbourhood." (See Dr.
Haygarth's pamphlet, "On the Epilepsy, a Caute and
as a Cure of Disorders of the Body; exemplified by fit-
tious Tractors, and epidemical Convulsions," 1800.)
This intelligent physician, after preferring some antipsy-
chotic medicines, advised Mr. Griffith to use all his authority to
prevent girls and young women from having any communi-
cation with persons afflicted with these convulsions, and to
keep those who were ill of the distemper separate from each other,
asmuch as possible. "I warned him," Dr. Hay-
garth says, "if these cautions were not observed, the
epidemic might spread throughout the whole island of An-
geley." Loc. cit. p. 35.
Dr. Haygarth was led to take this view of the subject,
from his recollection of the case of the children in the poor-
house at Haerlem, and of the occurrence of a convulsive
disease of the hysterical kind, which, about thirty years
before, had spread through the thrre of Angus, in Scotland.
Several imperfect descriptions of this malady may be found
in the "Statistical Account" of Scotland. (See also Edin.
Dr. Whytt long ago noticed the frequency of convulsions
in Zetland, and he added the extreme facility with which they
were propagated among the young women of that
island,as a proof of the existence of a wonderful sympathy
between the nervous systems of different individuals, by
means of which various motions and morbid symptoms are
often transferred from one to another, without any corporal
contact or infection. (Essay on Nervous Disorders, chap. iii.
sect. vi.) An account of this disease, related by the
minister of the parish of Udsh, the most northerly of the Scot-
lands, is given in the Edinburgh Journal, just quoted.
"There is a shocking distemper, which has of late years
prevailed pretty much," (he writes in 1754,) "especially
among young women, and was hardly known 30 or 40 years
ago. About that period only one person was subject to it:
The inhabitants gave it the name of convulsion fits; and,
indeed, in appearance, it something resembles an epilepsy.
In its first rise, it begins with a paroxysm in the head, of
which it usually complained for a considerable time; it at length
produced swooning fits, in which people feized on it would it
be motionless upwards of an hour. At length the dis-
temper gathered strength, when any violent passion feized,
or on a sudden surprize, they would all at once fall down, to
their arms about, writhe their bodies into very odd shapes,
crying out all the while most violently, throwing their heads
about from side to side, with their eyes fixed and staring.
At first this distemper obtained in a private way with one
female, but the being feized in a public way at church, the
disease was communicated to others, but whether by the
influence of fear or sympathy is not easy to determine." (P. 438, vol. iii.) In another of the northern parishes,
Delting, the disease was very prevalent. "The patient is
first feized with something like fainting, and immediately
after utters wild cries and shrieks, the sound of which, at
whatever distance, immediately puts all who are subject to
the disorder in the same situation. It most commonly
attacks them when the church is crowded, and often interrupts
the service in this and many other churches in the country.
On a sacramental occasion, fifty or sixty are sometimes
carried out of the church, and laid in the church yard, where
they struggle and roar with all their strength for five or ten
minutes, and then rise up without recollecting a single cir-
sumstance that happened to them, &c." (See Statistical
Account, vol. i. p. 383, 1791.) In this description we
recognize the features of hystcrion; and the influence of
moral causes in removing, as well as in inducing these con-
volutions, was evinced in the parish of Northmaven,
where the disease was thus extinguished. "The cure is at-
tributed to a good fellow of a kirk-officer, who told a
woman in that state, with whom he had been frequently
troubled, into a ditch of water. She was never known to
have the disease afterwards, and others dreaded the like
treatment." (Stat. Acc. vol. xii. p. 363, 1794.) Here
the principle of cure was perfectly analogous to that reftored
to by Bocareve in the work-houfe at Haerlem.
Every species of mental emotion is propagated in a similar
manner among crowds of people under various circumstances,
and the more readily when they are accompanied by cor-
poreal actions. If the sight of a number of persons, in the
act of yawning, almost irresistibly impels us to yaw with
them; so the sight of a multitude of sorrowful counte-
nances, or of countenances in furious anger, carries us into
similar feelings, and renders us most acutely susceptible of
corresponding impressions from the sight of tears. Hence
arises much of the magnanimity of armies, on the one hand,
and the facility of the propagation of panic, on the other;
ence the uncontrollable fury of mobs, &c. But there is
no general emotion, which renders the body more com-
pletely subservient to every degree of this sympathetic or
instinctive influence, than that of religious enthusiasm.
This was exemplified, in a striking manner, in the epidemic
convulsions, which occurred in the parish of Cambellien,
Linlithgow, in 1742, and is well described by Dr. Meik.
The minister, Mr. McColloch, who was much interested, and
a follower of Whitefield, by incitant zeal and labour in his
vocation, and by reading and circulating, in halfpenny pam-
plets, various mislies, sermons, and journals, giving an
account of visions in different parts of the world,
exercised an extraordinary concern about religion in his
neighbourhood. In consequence of a petition, signed by
many of the families, a weaver, and a shoemaker,
IMITATION.

In the third place, he gave evening lectures on the week days occasionally; and afterwards they were daily employed for many hours in fervent prayer; in the minister's house, and hearing his lectures; and great numbers cried out publicly, and many returned to his house expressing strong convictions of sin and alarming fears of punishment. "The way in which the converts were affected," says Dr. Meik, "for it seems they were affected much in the same way, though in very different degrees, is thus described. They were seized all at once, commonly by something said in the sermons and prayers, with the most dreadful apprehensions concerning the state of their souls, insomuch that many of them could not abstain from crying out in the most public and frightful manner, "bewailing their lost and undone condition by nature, &c. &c.; declaring that they saw the mouth of hell open to receive them, and that they heard the shrieks of the damned;" but the universal cry was, "what shall we do to be saved?"" The agony under which they laboured, was expressed not only by words, but also by violent agitations of body; by clapping their hands and beating their breasts; by flitting and trembling, by paintings, and convulsions; and sometimes by excessive bleeding at the nose. While they were in this distress, the minister often called out to them, not to flithe or smother their convictions, but to encourage them; and after the sermon was ended, he retired with them to the manse, and frequently spent the best part of the night with them in exhortations and prayers." &c. Some of these, it is said, who thus "fell under conviction," were never converted; but some were converted in a few hours.

It is impossible to read this account without recollecting the operations of Meik with his animal magnetism, and their close similarity with these fanatical proceedings; especially the exact analogy of the phenomena, when the magnetized persons were laid to fall into the cries ("tonber en crise"), and these seizures to fall under conviction. Both these events were the result of strong impressions on the imagination continued for some time; in both, the sighings and sobbings, the fasings and convulsions occurred; and in both these cries were most rapidly produced, after one person had become thus affected. (See IMAGINATION.) Under the article just referred to, we have added the demonstrative proofs, obtained by the French commissioners, that all these phenomena attributed to magnetism, were the products of the heated imagination, augmented by the principle of imitation; and we cannot but refer these analogous effects of fanaticism to the same natural causes. Upon this ground they were generally explained at the time by rational people. "That the work of Cambungul ought to be ascribed neither to the influence of the Holy Spirit, nor to the influence of the devil, but to the influence of fear and hope, of sympathy and example, aided by peculiar circumstances, was the general opinion of those," Dr. Meik observes, "who are known in the church of Scotland by the same of the moderate party. The only extraordinary circumstance relating to this work, is the external effect on the bodies of men by which it manifested itself; and these, they thought, might be sufficiently explained by the operation of natural causes, &c." "When this work was once begun, they maintained, that the effects of sympathy and example (i.e. the principle of imitation) sufficiently explain its future progress. Every day's experience shows that we are disposed to imitate the actions of others, and that we are naturally, and, as it were, mechanically moved by seeing them, either in the depth of distress, or in the height of exultation. The operation of these principles was visible in almost every instance. Whenever any one was affected, many others were affected in a similar manner. Whenever any one cried aloud, either through excessive grief or joy, but especially the former, many others cried aloud likewise, using the same words, or words of the same meaning. Statrif. Acc.

At about the same period, and in the summer of 1803, a species of chorea, or St. Vitus dance, became epidemic in Tennessee, in America, connected with the prevalence of religious enthusiasm. Great numbers of people were collected together, especially at their extraordinary meetings, which commonly lasted from three to five days; and many of them remained on the spot day and night, the whole or greater part of the time, worshipping their Maker almost incessantly. "The outward expressions of their worship consisted chiefly in alternate crying, laughing, finging, and flowing, and, at the same time, performing that great variety of gesticulation which the muscular system is capable of producing. It was under these circumstances that some found themselves unable, by voluntary efforts, to suppress the contractions of their muscles; and to their own astonishment and the diversion of many of the spectators, they continued to act from necessity the curious character which they had commenced from choice. The disease no sooner appeared than it spread with rapidity through the medium of the principle of imitation: thus it was not uncommon for an affected person to communicate it to the greater part of a crowd, who, from curiosity or other motives, had collected around him. It is at this time (1803) in almost every part of Tennessee, and in various parts of Virginia; but it is said not to be contagious (or readily communicated) as at its commencement. It attacks both sexes, and every constitution; but evidently more readily those who are enthusiastic in religion (such as those above described), and females; children of fix years of age, and adults of sixty, have been known to have it; but a great majority of those affected are from fifteen to twenty-five. The muscles generally affected are those of the trunk, particularly of the neck, sometimes those of the superior extremities, but rarely, if ever, those of the inferior. The contractions are sudden and violent, such as are denominated convulsive, being sometimes so powerful, when in the muscles of the back, that the patient is thrown on the ground, where for some time his motions more resemble those of a live fish, when thrown on land, than any thing to which I can compare them. This, however, does not often occur, and never, I believe, except at the commencement of the disease, &c." See an Inaugural Essay on Chorea Sancti Vitii. By Felix Robert, on of Teneffee, Philadelphia, 1805. Edin. Med. and Surg. Journal, vol. iii. p. 446.

In consequence of the facility with which such convulsive motions are communicated by imitation, various corporeal movements which fanaticism or enthusiasm has associated with devotional exercises, have become characteristic of certain sects, to which they have even given names. From this source, it would appear, have originated the apppellations of Jumpers, Whirlers, Tremblers; and even our now placid sect, the Quakers, have doubtless derived their denomination from some similar habit. A singular phaenomeanic disease, the chorea St. Viti, or Saint Vitus's dance, has most probably derived its appellation from the resemblance of the involuntary motions of the limbs to some of those religious or fanatical gesticulations. Tradition states that it was so named from the annual religious assemblies and fanatical dances, in honour of St. Vitus, which were celebrated on the first of May, at Ulm and Ravensburg, and other parts of Germany. See CHOREA.

This subject is far from being exhausted. The preceding
ATTENDS, however, seem to afford a satisfactory illustration of a sympathy, or a mechanical, i.e. an involuntary tendency to imitation, which is a part of the human constitution, and is as visible in the flight of actions, such as yawning, as in those which can be forcibly arred attention, and excite emotions, such as convulsive fits. And when to this principle we add the power of the imagination over the physical state of the body, as evinced by the effects of metallic and counterfeit trinkets, of the touching of kings and other gifted persons, of fainting shivers and relays, and of animal magnetism, &c.; we are enabled to explain the occurrence of a number of extraordinary phenomena in the history of man, which, if we viewed his moral and physical faculties separately, would appear altogether inexplicable by natural causes.

Dr. Haygarth has deduced this practical inference, for the direction of the physician, from the consideration of these facts; namely, that convulsive disorders ought not to be admitted into the female wards of hospitals; a suggestion which he caused to be acted upon in the Choller Infirmary. And it is important to know that, in districts where convulsive difeases are observed to be spreading, any medical or other intelligent and humane neighbour, who has influence and authority to hinder all intercourse between persons afflicted with and liable to such disorders, may prevent such calamities. See Dr. Haygarth’s pamphlet, also Rapport des Commisaries above quoted, p. 67, note, where separation was proved to be an effectual cure. Similar cases may be found, in a work of M. Hecquet, “Le Naturalisme des Convulsions.”

IMITATION, in Oratory, is an effort to resemble a speaker or writer in noble qualities, with regard to which we propose them to ourselves as patterns. The first historians among the Romans, says Cicero, were very dry and jejune, till they began to imitate the Greeks, and then they became their rivals. It is well known how closely Virgil has imitated Homer in his Æneid, Heifiod in his Georgics, and Theocritus in his Éclogues. Terence copied after Menander; and Plautus after Epicarmus, as we learn from Horace, lib. ii. ep. ad August., who himself owes many of his beauties to the Greek lyric poets. Cicero appears, from many passages in his writings, to have imitated the Greek orators. Thus Quintilian says of him, that he has expressed the strength and sublimity of Demosthenes, the copiousness of Plato, and the delicacy of Ictocrates. Inf. Or. lib. x. cap. 7.

While some have proposed three enquiries under the head of imitation, viz. Who are to be imitated? What are we to imitate? and in what manner? With respect to the first we shall only observe, that in common cases it is not always what is absolutely best, but comparatively so in its own kind, and best suits its own taste, that should determine perasons in the choice of their patterns for imitation: however, only the best writers, and those whom we can most safely trust, says Quintilian, are to be read long. With respect to the second enquiry, the things to be imitated are the perfections of the best masters in their several kinds; and these are different, according to the various subjects in which they excel. As to the manner of imitation, it ought to be considered, that he who only copies or translates from another, and endeavours to pass it off for his own, is not an imitator but a plagiarist. The true art of imitation conveys in so diversifying what we take from others, as, if we can, to improve it, or at least not suffer it to receive any detriment by our alteration. And this may be done, by fo enlarging a thought, or expression taken from another, as in a good measure to render it our own: by either abridging, or only taking a part of what another has said before us; by keeping the thought and applying it to a different subject; and finally, by preferring the thoughts and applying them to the same subject, but changing their order, and representing them in a different dress. See Ward’s Orat. vol. ii. sect. 53 and 54.

IMAGINATION, Imitation, in Imag. See Fugato.

IMIZIMIS, in Geography, a town of Morocco, on the mountains of Atlas; 63 miles S.W. of Morocco.

IMIATSKAÀ, a town of Russia, in the government of Ufa, on the river Imit; 60 miles N.E. of Tchelabinsk.

IMMA, in Ancient Geography, a town of Asia, in Syria; situated at the northern point of a mountain E. of Orotontes, towards the south-call of Antiochia.

IMMULATE, without stain, a term much used among the Romanists: when speaking of the conception of the Blessed Virgin, they call it immaculate.

When the cap is given to a doctor of the Sorbonne, he is obliged to swear that he will defend the immaculate conception. This was decreed by an act of the Sorbonne in the fourteenth century; in imitation of which, eighty other universities made the same order.

The military orders in Spain are all solemnly obliged to defend this prerogative of the Virgin. See Conception.

There is also a Congregation of the Immaculate Conception; in most nunneries whereof is a society of secular maids, whose end is to honour the immaculate conception: of which they make a public proclamation every year, and a private one every day. See Theatines.

IMMANENT, in Logic. The schoolmen distinguish two kinds of actions; the one transient, which passes from the agent to the patient; the other immanent, which continue in the agent. See Action.

IMMATERIALITY, abstraction from matter, or what we understand by pure spirit.

Plato proves the immateriality of the soul from these six topics. 1. Its simplicity. 2. Its independence on the body, which is twofold; in its ess, and in its operation in existing, and in acting or operating separately. 3. Its rule and authority over the body. 4. Its likenesses and similitude to God, which discovers itself in the pleasure it enjoys in spiritual things, in its aiming at spiritual objects, &c. 5. Its spiritual manner of perceiving material objects. And, lastly, its indivisibility, capacity, activity, and immortality. See Soul.

IMMEDIATE, that which precedes or follows some other thing, without any interpolation.

IMMEDIATE also signifies something that acts without means, or without medium. In which sense we say, immediate grace, and immediate cause, &c.

IMMEDIATE Mode. See Mode.

IMMEDIATE Fire. See Fire.

IMMEMORIAL, an epithet given to the time or duration of any thing whose beginning we know nothing of.

In a legal sense, a thing is said to be of time immemorial, or time out of mind, that was before the reign of our king Edward II.

IMMENDORF, in Geography, a town of Austria, eight miles N. of Sonneberg.

IMMENH.AUSEN, a town of the principality of Hesse-Cassel; eight miles N.W. of Cassel. N. lat. 51°. 5'. E. long. 9°. 25'.

IMMENSE, that whose amplitude, or extension, is finite.
finite measure whatsoever, or how oft ever repeated, can equal.

IMMENSTADT, in Geography, a town of Germany, in the county of Koniglugg, on a small river, which flows after the Ille; 12 miles S. of Kempten.

IMMER, one of the islands called New Hebrides, in the South Pacific ocean. S. lat. 19° 10'. E. long. 169° 46'.

IMMERETIA. See IMRETTA.

IMMERSION, an act by which any thing is plunged into water, or some other fluid.

In the first ages of Christianity, baptism was performed by immersion; by three immersions. The custom of immersion is said to be still preferred in Portugal, and among the Assaguti in other parts. See Baptism.

IMMERSION, in Pharmacy, is the preparation of some medicine, by letting it steep for some time in water, in order to take some ill quality or taint from it.

This is done in rubbath, to moderate its force; in lime to take away its salt; and in olives, which are preferred in Britain.

IMMERSION, in Astronomy, is when a star or planet comes so near the sun, that we cannot discern it; being as it were enveloped, and hid in the rays of that luminary.

IMMERSION also denotes the beginning of an eclipse of the moon; that is, the moment when the moon begins to be darkened, and to enter into the shadow of the earth.

The same term is also used with regard to an eclipse of the fun, when the disk of the moon begins to cover it.

In this sense, immersion stands opposed to emergence, which signifies the moment wherein the moon begins to come out of the shadow of the earth; or the fun begins to show the parts of his disk which were hid before.

IMMERSION is frequently applied to the satellites of Jupiter, and especially to the first satellite; the observation whereof is so muchUse for discovering the longitude.

The immersion of that satellite is the moment in which it appears to enter within the disk of Jupiter; and its emergence the moment wherein it appears to come out.

The immersions are observed from the time of the conjunction of Jupiter with the fun, to the time of his opposition; and the emergences from the time of his opposition to his conjunction. The peculiar advantage of these observations is, that during eleven months of the year they may be made, at least, every other day. The perfection of the theory, and the praxis thereon, we owe to M. Caillou.

IMMERSION, Scruple of. See SCRUPLE.

IMMOURTO, an inability of retaining the urine. See INCONTINENCE OF URINE.

IMMORTAL, that which will last to all eternity, as having in itself no principle of alteration or corruption.

Plato defines immortality ΙMmorTALITY as an airtial or artificial essence and eternal 마음; and proves the immortality of the soul from two kinds of arguments; the one artificial, and the other inartificial.

The inartificial arguments for the soul's immortality are testimonies and authorities, whereof he cites several; and adds in general, that all the great men and poets, who had any thing divine in them, have at all times affirmed the immortality of the soul.

Artificial or proper arguments for the immortality are either speculative or practical: 1. Of the first kind are those drawn from: 1. The simple, uniform, spiritual, and divine nature of the soul. 2. From its infinite capacity. 3. Its delighting and longing after immortality, and its inward horror of falling into nothing; proving it absurd that the soul should die, when life is its proper and adequate object. 4. Its rational activity; proving that whatever has in itself a principle of rational and spontaneous motion, by which it tends towards some supreme good, is immortal. 5. The various ideas which it has of spiritual things; particularly the idea it has of immortality: and, 6. Its immateriality.

His practical or moral arguments for the immortality of the soul, are drawn from. 1. The justice of God, which can never suffer the wicked to escape unpunished, nor the good unrewarded after death. 2. The dependence which religion has on this opinion, because, without this persuasion, there would be no religion in the world. 3. The opinion which men have, that justice and every kind of virtue are to be cultivated, that they may at last live with God.

4. The things of confidence, and anxious solicitude we are under about a future state. See SOUL.

IMMORTAL FLOWER, in Botany. See GOMPHREX.

IMMUNITY, a privilege or exemption from some office, duty, or imposition.

Immunity is more particularly understood of the liberties granted to cities and communities.

The princes heretofore granted all kinds of immunities to ecclesiastics, exempting them from all impositions; but the ecclesiastics of those days were not so rich as those of ours: they gave all they had to the poor.

There is ill a privilege of immunity in some places, and especially in Italy, belonging to ecclesiastical things, and persons; who are exempted from certain dues, and are sheltered from the pursuits of justice. Though there are some crimes for which they cannot plead the privilege of their immunity, as premeditated murder, &c.

IMMUTABLE SYSTEM. See System.

IMMUTABILITY, the condition of a thing that cannot change.

Immutability is one of the divine attributes. See God.

IMMYSNS, John, in Biography, a self-taught musician, said to have become a notable lutenist after 40, by the perusal of Master Mace, whose ideas, taste, and language seem to have been perfectly congenial. Immyns founded the Madrigal society, and was so convinced of the perfection of that species of music, particularly of queen Elizabeth's reign, that he looked on Handel and Bononcini as the great corrupters of the science. He had a cracked counter-tenor voice, played on the common flute, the viol da gamba, violin, and harpichord, but on none of them well. Though originally an attorney, there was doubtless a conflict between the two professions—

"but music won the cause."

However, with all his harmonical zeal and enthusiasm, he never obtained a higher rank in the profession, than that of amanuensis to Dr. Pepusch, and copyist to the Academy of Ancient Music at the Crown and Anchor. Yet he was always in cheerful spirits, and the honour of having established the Madrigal society, and being its chairman at different alehouses in the city, presiding over dilettante tradesmen, mechanics, and palm fingers, contributed as much, perhaps, to his pride and felicity, as the being president of the Royal Society, or speaker of the house of commons could have done. But alas! the tyrant Death dragged him from all his sublunary felicity in 1764.

IMOLA, Innocenzo da. See Francucci.

IMOLA, in Geography, a town of Italy, in the department of the Amaona, anciently called "Forum Cornelli," or "Forum Julia," situated on an island, formed by the river Sele, surrounded with walls, towers, and ditches, and de-
fended with a strong castle; the see of a bishop, suffragan of Ravenna. It contains 16 churches and 17 convents. After having been occupied by different popes, Cenaf, Borgia became a monastic city, and afterwards, with the reft of Romagna, to the dominions of the church; 18 miles S.E. of Bologna. N. lat. 44° 22'. E. long. 11° 32'.

IMOMAGUR, a town of Hinduftan, in Bahar; 25 miles E.S.E. of Bahar.

IMORI, a town of Japan, in the ifland of Niphon; 16 miles S. of Meaco.

IMPACHED, a town of Austria; six miles W.N.W. of Crems.

IMPALLED, in Heraldry, is understood of a shield party per pale, or divided into two halves by a line drawn pale-wise through the middle, from the top to the bottom.

When the coats of arms of a man and his wife, who is not an heiress, are borne in the same escutcheon, they must be impaled, or marffalled in pale, i.e. the husband's on the right fide, and the wife's on the left; and this the heralds call 'baron and femme,' two coats impaled.

Impaling hath been practifed in three different ways:

1. By dimidiafion, that is, by halving or cutting the fides of the arms of both husband and wife into two equal parts, and then joining the dexter half of the husband's coat to the sinister half of the wife's; thus making up or forming a whole shield. In this mode, called "Accoless," the French kings used to impale the arms of Navare. The 2d mode is by dividing the husband's arms, and impaling that with the full coat of the wife's. The left general and prefent rule is that of impaling the two whole coats, except when there is a border round one or both of them; for the border muft never be carried all round an impaled coat. This dimidiafion of arms was much ufed in the reign of King Edward I.; in proof of which it is afferred by Mr. Sandford in his "Genealogical Hiftry," that Margaret, fifter to Phili-pp IV. king of France, and second wife to King Edward I., had, on her seal, in 1299, the arms of England fo divided with those of France, and that she was the firft queen of England who had her arms so marffalled. This method of impaling arms by dimidiafion hath been for some time laid aside in England, though it has been continued in France. It was a fuperb practice with the nobility of England, from the reign of Edward III. to that of Henry VII. to quarter the arms of the wife; and also to place her arms in the firft quarter, in preference to the paternal coat of the husband's family, particularly if her family was of greater dignity; and Mr. Nibet, in his "Syftem of Heraldry," informs us, that it is a cuftom in Scotland, when a man marries an heiress, for him to quarter her arms with his own paternal coat; but he allows that it is not practifed in any other country. Our heraldic authors fay, there are the rules to be obferved in impaling the arms of husband and wife.

2. The husband's arms are always to be placed on the right fide as baron, and the wife's on the left as femme. 2dly. That no husband can impale his wife's arms with his own, on a furcoat of arms, enflag or banner, but may use them impaled on other utenfils. 3dly. That no husband impaling his wife's arms with his own, can impale them with the dexter half of the wife's arms; becaufe, as Mr. Sandford argues, although the husband may give his equal half of his efcutcheon, yet he cannot bear his temporary order of knighthood with her, except he be Sovereign of the order. The mode lately adopted for knights of the Garter, Bath, and Thiffle, to wear their arms and theohe of their wives in two separate shields, with the garter or order round their own coat only, is taken from the French; but Mr. Edmondfon does not hold this to be good armoury, because the arms cannot be foi without being impaled baron and femme, as hath been usual in England upwards of two hundred years. However, on the deceafe of the knight her husband, when she becomes a widow, the wife ought not in any refpect to bear the garter round her arms, becaufe, on the demise of the knight, his honour of knighthood returns to the crown.

It hath been laid down as a rule by many, that if a man hath had two wives, he may impale both their arms on the finifer fide, thofe of the firft wife in chief, and thofe of the second in base. He hath alfo been faid, that if a man hath had two wives, he may place his own arms in pale, and thofe of his two wives on the dexter and fimifer fide, giving the firt the dexter fide; and fo, if he had fix wives, he may place the arms of three of them on the dexter fide, and thofe of the other three on the fimifer fide. But the errors of these positions, fays Mr. Edmondfon, are fo flagrant, that they need little argument to refute them. The intent of impaling a wife's arms is to fhew that the man is then married to a woman of that particular family, whose arms are impaled with his own; therefore, when by her death he is released from that marriage, he ceafes to bear the arms of her family. The cafe is different in regard to a widow: whilft she remains fuch, she is obliged to bear the arms of her deceased husband.

Kent afferts that no women, except fuch as are heiresses, are entitled to have their arms impaled with thofe of the husband; but this is absurd, becaufe impaling arms is intended to point out the family into which the husband is married, and not to indicate that the wife brought with her any real or personal property whatever. In impaling the wife's coat, you never put any marks of cadency for the firft, second, and third daughfer; but if there be any marks of cadency on the father's coat, all his daughters muft continue the fame.

Impaled arms are alfo borne by officers, as well ecclefiafical as civil, as archbishops, bishops, kings of arms, &c.; but with this difference from thofe of the manner of impalement of the arms of baron and femme, viz. that the arms of the church are to be placed on the dexter fide, and the wife's on the fimifer fide. The like rule is to be obferved in relation to civil officers.

IMPALEMENT, in a penal fene. See Impalement, in Phyfology.

IMPALPABLE, that whose parts are fo extremely minute, that they cannot be diftinguifhed by the fenes, particu- larly by that of feeling.

IMPANATION, formed of in and panis, bread, a term ufed among divines to fhew the opinion of the Lutherans with regard to the eucharift; who believe that the fpecies of bread and wine remain, together with the body of our Saviour, after confluence. See Consuftantia-

IMPANATORES. See Deffenarii.

IMPANNELLING, in Law. See Empanelling.

IMPARES SCAMILLI. See Scamilli.

IMPARFAIT; Fr. imperfect. This word has many acceptations in muifc: as an imperfect chord, imperfect concord, imperfect cadence, &c. always oppofed to perfection. The bearings which temperament requires, and which every interval, except the octave will allow, without greatly offinding the ear, occafion imperfect intervals. See Interval and Temperament.

IMPARLANCE. See Empanlance.

IMPARSONEE, in Law, is applied to a parfon that is inducted, and in poftion of a benefice.

IMPARTITO, Ital. is laid of the folution of a canon, when it is written in fcore, or drawn out in different parts;
in opposition to **canone ehius**, or a cannon wrap up in mystery.

**IMPASSIBLE**, that which is exempt from sufferings; or which cannot undergo pain, or alteration.

The Stoics place the soul of their wife man in an impallible, imperturbable state. See **ARATHY**.

**IMPOSTATION**, the mixture of divers materials of different colours and confinences, baked or bound together with some cement, and hardened either by the air, or fire.

**IMPOSTATION** is sometimes used for a sort of mason's work, made of tluoco, or some ground small, and wrought up again, in manner of a palette.

Authors are of opinion that the obdl lifes, and the huge antique columns still remaining, were made, some by impostation, and others by fusion; but this is wholly erroneous; they are all cut out of quaries, yet open in Egypt, Arabia, 

**IMPASTING**, in **Painting**. See **EMPASTING**.

**IMPATIENS**, in **Botany**, is a genus so named from the great dillacity of the futures of its seed vesels, which is completely impatiet of the touch, curling up with the greatest velocity, and scattering round the seeds, the ilinst any extraneous body comes in contact with it. From this remarkable circumstance it has obtained the English appellation of "Touch me not." Linnaeus, 478. Schreb. gen. Wild. Sp. Pl. t. 1175. Mart. Mill. Ditt. v. 2. Sm. Fl. Brit. 242. Ait. Hort. Kew. v. 3. 292. (Balfamina; Jull. 270. Tournef. t. 235. Caretn. t. 113.)—Chfs and order, **Pentandria Monogynia**. Nat. Ord. Corydalis, Linnaeus.

Gen. Ch. Cal. Perianth very small, of two roundish, pointed equal leaves, placed towards the sides of the flowers, coloured, deciduous. Cor. Five-petalled, irregular; the upper petal roundish, flat, slightly trifid, making a sort of upper lip; lower pair very large, obtuse; intermediate pair opposite, rising from the base of the upper petal; nectary receiving, like a hood, the base of the flower. Stam. Filaments five, very short, narrower towards the base, curved; anthers five, connate, divided at the base. Pid. Germen superior, ovate-acuminate; style none; stigma simple, shorter than the anthers. Petio. Capsule one-celled, five-valved, burting longitudinally and with great dillacity, the valves rolling spirally. Seeds several, roundish, fixed to a columnar receptacle.

Obs. The anthers being united induced Linnaeus and many other authors to refer this genus to **Strychnos Monogynia**; but since the abolition of that order from the Linnaean system, it of course belongs to **Pentandria Monogynia**. In some species the middle petals are wanting, and in some the horn of the nectary. The capsule differs in figure; hence the **Impatia** of Rivas has a long capsule, and his Balfamina in ovate one.

1. I. **Noli me tangere**. Yellow balm of, or Touch me not. Linnaeus, Sp. Pl. 1269. Engl. Bot. t. 937. "Flower-flats foliary, bearing many flowers. Leaves ovate. Joints of the stem swelling."—Not unfrequent in the northern parts of England and Wales, particularly in the neighbourhood of the lakes of Cumberland, flowering in August—rost fibrous, small, spreading horizontally. Stem foliary, erect, about two feet high, succulent, pellicul, smooth and polished. Leaves alternate, on foot-flats, ovate, obtuse, serrated, the lower serratures briefly; Villars remarks they become flaccid and as if withered in the night, but this is not always the case. Flower-flats axillary and branched, bearing three or four yellow, pendulous flowers, dotted with red internally. Nectary funnel-shaped, with a recurved top. Capsule oblong, gibbous, pendulous; its valves so elastic that they burst and scatter the seeds before the capsule is ripe. Hence the Latin names of "Impatia" and "Noli me tangere"; and the English names of "Quick in hand," alive, as it were, in the hand. Gerard calls it "Colded Arimart," and Parkinson, "Wild Mercury." The dillacity of the seed-vesel has furnished names in most of the European languages. In the day time the leaves are expanded, but at night they hang pendant, contrary to what is observed in most plants which, from a deficiency of moisture, or a too great perspiration from heat, commonly drop their leaves during the day. This plant was formerly considered as diuretic and vulnerary, and was given to relieve the hemorrhoids and the strangury. Boerhave regarded it as pensive. It is now configned wholly to the flower-garden, where, however, it is not often seen. It is the only species of impatians wild in Europe. It is also found in Canada. With us, it occurs in Wales and the northern counties of England, in moist shady places, and by the banks of rieulets. It flowers in July and August.

We have described the only British species of this singular genus. Willdenow enumerates twelve species, which, like the seven Linnaean ones, are divided into such as have single-flowered peduncles, and such as have many flowers on each flalk, in which latter division the **Noli me tangere** occurs.

The seeds of these plants should be sown on a moderate hot-bed in the spring, and when the plants are an inch high, they should be transplanted on another hot-bed at about four inches distant each way, shading them from the sun till they have taken new root; after which free air should be copiously admitted to them, when the weather is favourable, and they should be often refreshed with water. When they are so large as to touch each other, they should be taken up with balls of earth to their roots, and each planted in a separate pot filled with light rich earth, and plunged into a very moderate hot-bed under a deep frame, shading them from the sun till they have taken fresh root. They should then be accustomed to the open air, into which part of the plants may be removed in July, placing them in a warm situation; where, in a favourable season, they will flower and make a fine appearance. But part should be kept in a glass case or deep frame, in order to get good seeds. Those who are curious to preserve these plants in perfection pull off all the single and plain coloured flowers from the plants which they preserve for seeds, leaving only those flowers which are double, and of good colours: and thus they may be continued without degeneracy.

**IMPEACHMENT**, from the Latin, impetere, to set upon, or attack; or rather from the French, empecher, to hinder, in Leer, is the accusation and prosecution of a person for treason, or other crimes and misdemeanours. Any member of the lower house of parliament may impeach any one belonging either to that body or the house of lords. The method of proceeding is to exhibit articles on the behalf of the commons, by whom managers are appointed to make good their charge. These articles are carried to the lords, by whom every person impeached by the commons is tried; and if they find him guilty, no pardon under the great seal can be pleaded to such an impeachment. (12 & 13 Will. III. c. 2.) A commoner cannot, however, be impeached before the lords for any capital offence, but only for high.
high misdemeanors. A peer may be impeached for any crime; the articles of impeachment are a kind of bills of indictment, found by the house of commons, and afterwards tried by the lords, who, in cases of misdemeanors, are considered not only as their own peers, but as the peers of the whole nation. This custom is derived from the constitution of the ancient Germans, who, in their great councils, sometimes tried capital accusations relating to the public: "feet apud concilium, accu privae quo, et dixerim capitis indebarior." Tacit. de Mor. Germ. 12. Blackf. Com. vol iv

Impeachment of Waffles, a reformatio committat of waffle upon lands and tenements; or a demand of recompense for wells made by a tenant who has but a limited estate in the land granted.

He that hath a lease without impeachment of waffle, hath by that a property or interest given him in the houses and trees, and may make waffle in them without being called to an account for it. See Waite.

Impeccables, in Church History, a name given to those heretics, who boasted that they were impeccable, and that there was no need of repentance; such were the Gnostics, Priscillianists, &c.

Impeccability, the state of a person who cannot sin; or a grace, privilege, or principle which puts him out of a possibility of sinning.

Impediments, in Law, are such hindrances as put a stop or delay to a person's seeking for his right by a due course of law. Permits under impediments are those under age, or coverture, non compus mentis, in prifon, beyond sea, &c., who, by a living in our laws, have time to claim, and prosecute their rights, after the impediments are removed, in case of fines levied, &c.

Impediments of Marriage. See Marriage.

Impedit, in Law. See Quake Impedit.

Impenetrability, a quality whereby a thing becomes unable to be pierced or penetrated; or a property of body whereby it fills up certain spaces, so that there is no room in them for any other body.

Impenitence, or Impenitency, an hardness of heart, which makes a person perfervere in vice, and prevents his repentance.

Imperative, in Grammar, is one of the moods or manners of conjugating a verb, serving to express a commandment; as go, come, &c. The imperative, according to bishop Wilkins, is one of the primary modes or moods, the indicative being the other: by this the speaker expresses his will to him that has the thing in his power; namely, to his superior by petition, to his equal by persuasion, and to his inferior by command; and the manner in which these affect the copula (be it fo, or let it be fo) is called the imperative mood, of which there are these three varieties, Wilkin's Real Character, part iii c. 5. The same distinction is observed by Mr. Harris, who makes the imperative mood a species of the requisitive when applied to inferiors, but when pertaining to equals, or superiors, it is a preceptive or optative. Hermes, p. 144. ed. 2d.

See Moan.

In Hebrew, and other oriental languages, the future tense has frequently an imperative figuration.

Imperator, among the Romans, a title of honour given to generals after a victory; first by the acclamations of the soldiers, and afterwards confirmed by the senate. See Emperor.

Imperatoria, in Botany, is supposed to have derived its name from its reputed imperial virtues in medicine, whence also it has obtained with our herbalists the applica-

Gen. Ch. Cal. Umbel univerfal flat-spreading; partial unequal. Involurop. universal none; partial very slender, with one or two leaflets, almost as long as the umbel. Perianth proper obsolete. Cor. universal uniform; flares all fertile; partial. Petals five, inflex-emarginate, nearly equal. Stam. Filaments five, capillary; anthers roundish. Pist. German inferior; styles two, reflexed; stigmas obtuse. Peric. none. Fruit roundish, compressed; gilbose in the middle, margined. Seeds two, ovo-ovate, marked on one side with two furrows, surrounded by a broad margin.

Maferwort has long been supposed a sovereign remedy against poison. Gerarde says it is "also singular against all corrupt and naughty aire and infection of the pettition—eures petrifical carbuncles and botches—cold fits of agues—dropisy—dissolves all ventifotis or windinefe of the flo-mach and other parts—and greatly helpeth such as have taken great sweets, bruises, or falls from some high place." This account of its virtues may lead us to suppose that this plant was confidered by ancient botanists as the malter-key of pharmacy. At present it is occasionally used as an aro-omatic, but is of course supererred by many plants which have the property in a superior degree.

Imperial, a name given by some authors to the Mean or Spigenol.

Imperfect Consonants, in Music. Sometimes the thirds and the sixths are, though improperly, called imperfect consonances, because they are of two kinds, major and minor of each; while the fifth and fourth are said by the writers to be perfect, because they never change; which, however, is not correct, since there is the minor, false, or flat fifth, or semidiminished, and the major, false, or sharp fourth, or tritone; and thus every note of the scale has its major and minor, as well as the thirds and sixths. (See Interval.) Dr. Calvert recommends some further definitions on this subject in his Musical Grammar, art. 189, &c.

Imperfect Chords, or incomplete, are such as do not include all their necessary sounds.

Imperf. Instrum. are those with a fixed number of notes or intervals in the octave, (less than 44; according to Maxwell,) as the common keyed-instruments with 12 sounds, flutes, oboes, bassoons, &c. and, in general, all such wherein the performer has it not in his power to vary his sounds, so as to produce perfect chords with other notes struck or founded at the same time, a thing impossible throughout the 12 keys major and minor, on any instrument which cannot command 44 different sounds with-
in the octave, according to Mr. Maxwell, or 60 at the least, according to Mr. Henry Lifton. The imperfect instruments in common use, are incapable of executing any tempered syltem of intervals except the isfotonie, or equal temperament, so that every key therein shall be alike harmonious, because wolves, bearing-notes, or intervals very different to what they are intended to be must occur, or be substihtuted for the proper ones, unless 21 founds at least can be introduced into the octave, as was done by Dr. R. Smith on his harpichords, or 21 notes, as is done on Mr. D’Loefchman’s patent pianofortes and organs for harmonizing 33 keys: we have already, under the article HAWKE’s Temperament, pointed out the impossibility of the 17 notes on that gentleman’s patent instriments performing without wolves in more than 23 keys, while some of them are not the most usual, or those which first arise in the regular order of modulation: all these if 12, 14, at the Temple, 16 at the Foundling organ, 17, 21 and 24 notes, are imperfect instruments, and incapable of yielding perfect or untempered harmony in any piece of music. See Perfect Instruments.

Imperfect Intervals, are such as have not a ratio expressible in small or whole numbers: thus, or the fourth, is a perfect interval, but or, is not a perfect interval; but the false, or trumpet fourth, or, is also an imperfect interval, the tritone. The tempered intervals, adapted to imperfect instriments, are imperfect intervals, whether such deviate one or more of some small interval from perfection, as the comma deficient fourth, the comma deficient fifth, the comma deficient minor third, &c.; or deviate any fractional part or parts of a small interval from perfection, as 1, 4/5, 3/4, a fifth flattened, 2/3 of the major comma for the mean tone temperament, 1/5, a fifth flattened 3/4 of the major comma for a system with perfect major sixths, &c.

Imperfect Plants, among Botanists, are such as either really want flower and seed, or are suppos’d to want them; no flower or seed having been discovered in the greater part of those plants included in this class by the botanical writers, at the time when they were thus denominated. See Plants. See Dark.

Imperfect Mixte. See Mint.

Imperfect Numbers, in Arithmetic. See Numbers.

Imperfect Tense, in Grammar, signifies an indefinite time between the present and the past; as, I taught, I heard. The imperfect was sometimes employed by the ancients to denote what is usual and customary: thus forget and forgetest signify not only he was rising, he was eating, but upon occasion they signify, he used to rise, he used to eat. The reason of this is, that whatever is customary, must be something which has been frequently repeated; but what has been frequently repeated must require an extension of time past. It was also used by the ancients, in which they have been followed by the moderns, in a supponitive kind of inscriptions; as ἄτοις, ἀπελευσθείτε, Apelles faceieth, but not ἀπελευσθή, or: for which use of the imperfect they avoided the flaw of ignorance, and had prepared an apology in case of censure, by saying that the work was once indeed in hand, without pretending that it was ever finished. Harris’s Hermaes, p. 136, &c. See Tense.

Imperfecto, ItaL imperfect. See Interval.

Imperfecto Anus. If sometimes happens, that infants are born with the anus imperforate, and when the defect is not soon discovered, and some endeavour made to obviate it, the consequences are, in a short time, almost invariably fatal. The afflicted infant is relieve, cries much, and suffers a frequent and distressing inclination to empty the rectum. In the fits of suffering, the child’s face swells, and its eyes become red, and more or less protruded from their sockets. At length the belly is affett with a general swelling and tenderness, and death takes place in four or five days, either from the inflammatory and gangrenous mischief within the abdomen, or from the convulsions excited. It is a very curious circumstance, however, that there are cafes on record, where children have lived several weeks, and even years, with an imperforate anus, the excrement having been discharge all such time by the mouth. (See Journal de Médicéine, anm. 1770, p. 510, and tom. 8, p. 60.) Such infallences, indeed, are exceedingly uncommon; but they are important, if at all, as they tend to evince, that the operation usuallie performed for the relief of an imperforate anus, may be attempted, even at a late period, with a considerable chance of success. When an infant labours under the above-mentioned complaints, and the malady does not come away, the practitioner is naturally led to examine the appearanee of the anus, and thus the nature of the case is detected.

There are various kinds of imperforate anus. Sometimes the termination of the rectum is shut up by a preternatural membrane, or thin portion of skin. This is the most common, and, at the same time, the most favourable case, both the diagnosis and treatment being free from all difficulty. The membrane, shutting up the anus, is plainly visible to the practitioner immediately upon his making the requisite examination, and, occasionally, it is so dis tended with the confined feces, that it projects from the anus in the form of a pouch or sac. Here the proper method is to divide the membrane with a bistoury, and if the part composing the obstruction is thick, the incision may be made in a circular shape, and four angles, or slits, cut away with the knife or scissors. Dressings and bandages are not required after the operation. The exit of the excrement and air prevents a closure of the opening; and it seldom happens that any symptoms arise, deserving particular notice.

Sometimes the lower end of the rectum is properly formed and open; but the intestine is inwardly closed at a greater or lefser distance above the anus. Such imperforate anuses is also occasionally produced by a preternatural membrane; though, in some cafes, it is the effect of an adhefion of the fides of the bowel together, there being, in fact, a total obliteration of the cavity of the intestine at the part which is imperforate. When the obstruction happens to be situated a very little above the anus, it may easily be felt by the finger; but when it occurs fo high up, that the finger cannot reach it, the case may be set down as irremediable. That a part of the rectum is impervious, may be inferred from the infant’s having no stools, and from the immediate discharge of clysters, whenever given to promote the passage of the excrement. In this circumstance, how can we venture to introduce any instrument, with a design of perforating the obstruction, without having the guidance of the finger, and without being able to know whether we are piercing the part composing the obstruction, or wound ing the side of the bowel? Whether, in no hopeless a cafe, it is proper to attempt the formation of an artificial anus, will be prefently considered.

When
IMPERFORATE ANUS.

When the obstruction can be felt with the finger an operation is admissible, and it may be most conveniently performed with the pharyngotomus introduced on the finger. A large curved instrument might also be used for the purpose; but the operation is neither free from difficulty in its nature.

In the event of the part of the intestine above the obstruction being greatly dis tended with feces, a kind of fluctuation is sometimes not only perceptible above the impervious place, but likewise through the coats of the bowel at the circumference of the obstruction; and in this case it is often exceedingly difficult to distinguish the exact situation into which the instrument ought to be pushed, so as to form a communication between the upper and lower portion of the intestine. Should the puncture be made in a wrong direction, the side of the bowel would be wounded, and a fatal extravasation of its contents into the pelvis be the consequence. A mistake of this sort would be the most difficult to avoid, were the intestines closed by a membrane of a thick firm texture; for then the fluctuation of the fecal matter would be less plain, just in the situation of the obstruction, than at the circumference. On the other hand, when the membrane, rendering the bowel impervious, is very thin, the fluctuation of the intestinal matter may be easily felt through it, and the practitioner has less difficulty in determining where the perforation ought to be made.

When the imperviousness of the bowel is the effect of an accretion of its sides together, and the intestinal canal is quite annihilated at the part, the fluctuation of the intestinal matter is less plain in the situation of the obstruction than at the circumference of it, and indeed may be quite imperceptible. In all such cases the operation cannot fail to be attended with considerable peril, as every thing depends upon the direction in which the instrument is introduced, which direction should be such as will open a communication between the upper and lower parts of the intestine, and can only be ascertained with difficulty. When the membrane that has been pierced is thin, no particular dressings are needed after the operation, the opening being more likely to be widened by the passage of the intestinal contents than to close again; but if the puncture has been made through a thick substance, surgical authors recommend a tent, or piece of a thick bougie, to be occasionally worn for some time after the operation, in order to prevent the opening from becoming shut up again.

In certain examples not the flightcell appearance nor vesicle of an anus can be discovered, the rectum terminates in a cul-de-sac. Here the operation is attended with several difficulties, and the event is therefore generally fatal. The greater or lesser distance of the cul-de-sac extremity of the rectum from the external integuments, however, is a circumstance making a material difference in the degree of hazard. The practitioner cannot ascertain this point unless the contents of the bowel happen to lie near the skin as to communicate to the fingers of an examiner the feel of fluctuation. When this is the case the operation is easy of performance, and the consequences for the most part successful. The farther the intestine is situated from the integuments, the smaller is the chance of being able to save the infant's life. When the end of the bowel lies very high up it may be impossible to reach and open it with a cutting instrument. Sometimes the rectum is entirely wanting, and the colon terminates in a cul-de-sac.

A more favourable case is met with where nature indicates the place in which the opening of the anus ought to be, by a red depression, small folds and wrinkles, or some such appearance. But, in many instances, the part is every where so even and uniform, that there is nothing to point out where the incision ought to be made. Here the knowledge of anatomy is the only light to the practitioner. He makes the first cut through the skin, between the coccygis and the beginning of the raphe of the perineum. He is to recollect, however, that in new-born infants the lower end of the rectum is not fo close to these coccygis as in adult subjects. An interstice, of nearly an inch, ought therefore to be left between the point of this bone and the posterior extremity of the incision. In male infants it is as well to introduce a catheter into the bladder before the operation. By this means the surgeon will not only be enabled to determine with greater precision the place of the first incision, but also to avoid the urethra as the wound is gradually made deeper. Surgical writers think it advantageous to make a crucial incision in the skin and subjacent cellular substance.

The first wound is to be gradually rendered deeper, care being taken to direct each stroke of the knife with the forefinger of the left hand. The principal objects in view are to avoid the urethra and bladder, and find out the end of the rectum. An injury of the urethra may easily be avoided; when care is taken to introduce a catheter before the operation, and to feel the instrument repeatedly with the left hand during the employment of the knife. Sometimes the rectum is so dilated with its contents as to press upon the neck of the bladder, and occasion a retention of urine. Here the dilated bladder might easily be wounded, were the surgeon, before the operation, to neglect to introduce a catheter, and draw off the urine. The surgeon is occasionally directed to the cul-de-sac termination of the bowel by the fluctuation of the accumulated feces; sometimes by a certain hardness which he perceives at the bottom of the wound, and which is produced by the sphincter muscle in a state of contraction. When there are no marks of this kind to guide him, nothing will be of any use to him except anatomical knowledge, and the rule always to incline the incision towards the os fæcum, where no important parts can be injured, instead of forwards, where the bladder, or vagina, is situated.

At length, the surgeon either succeeds in finding out the end of the intestine, or else his endeavours prove ineffectual, although the wound has already been carried to a considerable depth. When the extremity of the bowel is found, the infant is indeed relieved for the present, but it is far from being out of danger. Experience proves that the majority of children die after this operation. The cause of this fat is various; but, probably, it often happens that the side of the intestine is cut, and that an extravasation of the intestinal matter in the pelvis ensues. In the event of the bowel being found, the surgeon can do nothing more than make as capacious an opening in it as can be done with safety, promote the evacuation of the feces by gentle aperients, and place a tent in the wound in order to keep the new outlet puerous. The tent is always productive of irritation and pain, and consequently it should constantly be as soft and flexible as possible. A flexible tube is by no means an eligible instrument for introduction; for, if it should be too small, the fluids would not pass through it; and, if too large, it would give rise to pain and inflammation. Even when the operation is followed by favourable consequences, an involuntary discharge of the feces frequently continues. Cæsæ, however, do occur where the cure is in every respect perfect, the infant emptying its bowels naturally, and under the control of the will.

When the surgeon has carried the incision to a considerable depth, and cannot meet with the bowel, ought he to venture to cut still more deeply? The attempt, it must be confessed,
confessed, is attended with some danger, and is uncertain in its consequences; but as death is inevitable if no outlet for the feces can be procured, circumstances seem to justify such an endeavour to preserve the child. The occasional success, also, which has attended the proceeding, further corroborates its propriety. After extending the incision to the depth of two inches, without finding the intestine, a trocar, introduced an inch more deeply, has successfully opened the bowel. If, in such a case, the surgeon were to use a trocar, with a flint camou, the puncture might be immediately dilated with a bistoury passed into the tube.

When the rectum cannot be found and opened in the foregoing manner, Littre has proposed making an opening into the abdomen near the left groin, dividing the fignaile flexure of the colon, attacking the opened portion to the external wound, and thus establishing an artificial anus. This operation has not only been found very practicable upon the dead subject, but has actually been performed by Sabatier, Lehrbuch, &c. upon living infants with the happiest consequences. It is not to be difembled, however, that the event is exceedingly doubtful, especially as the practitioner can never know beforehand how far the large intestines may be closed, or where the cul-de-sac extremity lies; but, upon the whole, the operation certainly appears to be warranted, not merely on account of the hopeless condition of the infant, but because the attempt has unquestionably been known to succeed.

Calderon has proposed searching for the descending colon in the region of the loins. For this purpose he recommends an incision to be made on the left side of the spine, between the false ribs and the crista of the os ilium, upon the front edge of the quadratus lumborum muscle. It must be acknowledged, that in this situation there is more chance of finding the intestinal canal perversus; and that here an apparatus for lessening the inconveniences of an artificial anus admits of being more conveniently applied. But, all things considered, this operation is liable to more objections than the method proposed by M. Littre, which has likewise the important recommendation of having already proved successful.

Sometimes, besides the anus being imperforate, the large intestine has a preternatural opening into the urethra, or bladder. In female infants such a malformation is less pernicious in its consequences than in male children. In the former the meatus urinarius is short and dilatable, and the feces find a ready outlet; in the latter death usually ensues, unless an opening be speedily made for the passage of the excrement in the natural situation of the anus. Even when this has been executed, all the danger is not over; for it does not follow, as a matter of course, that the preternatural opening in the gut will close, because a new outlet has been formed. However, there are cases on record proving that this beneficial change may happen. Sometimes the preternatural opening in the intestinal canal is situated in the vagina or at the navel, in which circumstances external means may be employed to promote the closure. There are likewise cases recorded by writers, where women have dischred their feces, during the whole of their lives, through the vagina, or bladder.

In certain instances the anus is not closed, but only very small. This state is sometimes an original malformation. In other examples it arises after birth from a variety of causes, as after the operation for the fistula in ano, &c. The case may be cured, or at least relieved, by dilating the opening on each side with a bistoury, and employing tents.

Perhaps the most important case of impervious rectum is that which proceeds from a feirrhous induration and thickening of the coats of that intestine. Such disease is mostly seen in persons rather advanced in life, and more frequently in women than men. It ordinarily begins in a flow and invidious manner, producing at first several complaints, which are apt to be imputed to other causes, especially to piles. The case in the early stage is, therefore, in general not much understood. The patient feels an inclination to go to stool; but he voids little, and what comes away passes with great difficulty. He usually suffers floating pains about the rectum; and the agony is often so severe, particularly when the patient is at stool, as to induce fainting. The excrement which comes away is remarkably thin. As the disease advances, the rectum at length becomes quite impervious, and a miferere then comes on, which commonly proves fatal, as a free passage for the feces can seldom be procured again with sufficient celerity. The induration occasionally ulcerates, and the neighbouring parts are destroyed in various ways.

The disease may be detected by proper examination, in which the rectum will be found to be hard and contracted. Sometimes, on its inner surface, hard lumps and furrows can be felt. The more ancient and considerable the hardness is, the more difficult it is to be thus rendered impervious, in which circumstance the case is fatal. (See Mem. of the Med. Society of London, vol. ii.) The coats of the rectum have been found an inch thick, and quite cartilaginous.

Tents are the principal means of relieving the seerho-contracted rectum, just in the same manner as bougies are calculated for the cure of strictures in the urethra. Large bougies, made for the purpose, might also answer well for the dilatation of the rectum. But whatever instrument is used, its size must be gradually augmented. The passage of the fluids is every day to be facilitated withclysters. Several kinds of medicines have been tried internally, as cinna, mercury, burnt sponge, &c. Default found the mineral alkali very efficacious, to much so, that he sometimes effected a complete cure in the space of from three to fix months, even though the disease had fallen into the ulcerated state. The medicine, however, must always be continued, till the disease is entirely removed; for when the treatment is discontinued too soon, the disorder is apt to recur. Sometimes it is necessary to use the knife, that is, when an indurated transverse fold is formed in the rectum, so as both to hinder the passage of the excrement, and the introduction of the tent or bougie. Richter's Anfängigründe der Wundartzneykunft, Band 6. Kapitel 19.

**Imperforate Hymen.** See Vagina Imperforate.

**Imperforate Iris.** See Pupil, Clofure of.

**Imperforate Meatus Auditorius.** See Meatus Auditorius.

**IMPERIAL,** something belonging to an emperor, or empire.

Thus we fay, his imperial majesty, the imperial crown, imperial medals, the imperial chamber.

**Imperial Cities,** in Germany, are thofe which own no other head but the emperor.

These are a kind of little commonwealths; the chief magistrate whereof does homage to the emperor, and pays him the Roman month; but in other respects, and in the administration of justice, the magistrate is sovereign. The imperial cities have a right of coming money, and of keeping forces, and fortified places; their deputies affit at the imperial diets, where they are divided into two branches; that of the Rhine, and that of Suabia. There were formerly twenty-two in the former, and thirty-seven in the latter;
hatter; but there are now only forty-nine in all; thirteen belonging to the former, and thirty-fix to the latter.

**IMPERIAL Diet.** is an assembly or convention of all the states of the empire. See Diet.

**IMPERIAL Table.** In Surveying, an instrument made of brass, with a box and needle, i.e., used in measuring land.

**IMPERIALE.** In Geography, a town of Chili, situated on a river which runs into the Pacific ocean; destroyed by the Indians; 60 miles N. of Valdivia.

**IMPERII Recessus.** See Recessus Imperii.

**IMPERSONAL VERB.** in Grammar, is such an one, as is only used in the third person singular; as: a. tertet, hecat, &c. Every verb, says the ingenious Mr. Harris, whether active or passive, has in language a necessary reference to some noun for its nominative case; and the doctrine of imperative verbs has been justly rejected by the best grammarians, both ancient and modern. Hermes, p. 175.

**IMPROVISH.** A thing not to be pervaded, or passed through; either by reason of the closeness of its pores, or the particular configuration of its parts.

**IMPETICO.** In Medicine, a term which has been employed in many indefinite figurations by writers in the Latin language. Piny uses it as synonymous with the Lichen of the Greeks (Nat. Hist. lib. xx. cap. r.), in which he is followed by the majority; he is, however, inconsistent with himself, since, on other occasions, he employs the term to express other diseases. The definition which Celsius gives of Impetigo, does not in any respect correspond with the description of the Lichen given by the Greeks: he includes these distinctly and correctly under the head of Papula; and his Impetigo, as Sennertus remarks, is the Lepra of the Greeks (Cellf. de Medicinâ, lib. v. cap. 28. Sennert. Med. Pract. lib. v. cap. 50. Willan on Cutaneous Diseases, p. i. p. 38.) Sauvages and Cullen have adapted the term impetigo for the title of one of the orders in their respective systems of nomenclature, in the classis of Cachexia. The Impetigines, in Dr. Cullen's system, include those species of exudative diseases, which particularly discoulour and deform the skin and external parts of the body; namely, seborrhcea, syphillis, scurvy, elephantiasis, leprosy, jaundice, &c. (Claiss IV. Ord. III.) The Impetigines of Sauvages include only those chronic and commonly contagious diseases which are accompanied by clustered swellings, ulcerations, crusts, &c.; &c. syphilis, scurvy, elephantiasis, lepra, scabies, and tinea. (Claiss X. Ord. V.)

Dr. Willan confines the use of the term impetigo, as a genus to a papular eruption, commonly occurring in patches, and discharging a fluid, which, under one or two of its varieties, forms crusts or scabs on the surface; the running oozing of authors. But as the part of his treatise of cutaneous diseases, which will contain the description of impetigo, is not yet published, we are unable to enter farther into his views of the subject at present.

**IMPETRATION.** the act of obtaining any thing by request or prayer.

**IMPETRATION was more particularly used in our statutes for the pre-obtaining of benefices and church offices in England from the court of Rome, which did belong to the disposal of the king, and other lay patrons of the realm; the penalty whereof is the fame with that of provisors, 25 E. III. See Provvisor.

**IMPEX, in Mechanics. See Force, Momentum, and Motion.

**IMPETUS, Paracentric.** See Paracentric.

**IMPEY'S ISLAND.** In Geography, a small island in the Mergui Archipelago. N. lat. 10° 22'.

**IMPEZZATO, Ital.** See Epais and Spissus.

**IMPING, in Fowling, the inflicting a feather in the wing of a hawk, in the place of one that is broken.

**IMPIRA, in Geography, a town of South America, in the province of Cordova; 90 miles S of Cordova.

**IMPLANTATION.** See Transplantation.

**IMPLEAD, to sue, or prosecute by course of law. See pleading.

**IMPLEMENTS.** formed either from the Latin, implement, to fill up; or from the French, imploir, to employ; is used for all things necessary for a trade, or the furniture of a household.

In this sense we frequently find it used in wills, and conveyances of moveables.

**IMPLEMENT, in Agriculture, a term applied to any sort of tool or instrument by which any kind of work is executed.

**IMPLEMENTS OF HUSBANDRY, the several different kinds of tools or machinery by which the various sorts of labour and operations of the art are performed. They consist principally of spades, ploughs, harrows, plows, forks, hoes, mills, carts, waggon, &c. See these different heads.

In the formation and construction of all sorts of tools and machinery for the uses of the farmer, the principal aim should be, that of rendering the work they are to perform more cheap, easy, expeditious, and complete, by having them perfectly suited to the operations for which they are intended, and at the same time not too weighty, while they possess sufficient degrees of strength for the different purposes to which they may be applied. It is conceived by a late writer on rural affairs, that there is probably no sort of implements that admits of greater improvement than those employed in husbandry, on the principle of lessening weight, without materially diminishing the strength. It is strongly observed, that "every one knows that, if a beam of any length be made of equal thickness throughout its whole length, and a weight sufficient laid upon it, it will inevitably break in the middle, and never at either of the ends; yet, unless it be in the poles of a sedan chair, an instance can scarcely be recollected, in which weight has been diminished on this principle. On the contrary, it is not at all unusual, in the construction of such implements, to see the thicknesses diminished nearly one-half at the very weakest place, by means of a mortice cut out of it there, while its thicknesses in other parts are four times greater than would enable it to bear an equal burden." No attention is paid in placing the wood in that position wherein it is best able to resist the pressure to which it must necessarily be subjected; although it is very well known that the same quantity of materials may be made to bear in one position above ten times as much as it could do in another. It is well known that mortices weaken the wood to an astonishing degree when they are inadvisedly placed; yet it is no uncommon thing to see two crofs-mortiles, each of them twice the size that in any case could have been necessary, made through a beam, perhaps at the very weakest part of it, just as accident may direct, without even so much as an attempt to vary their position, far left to wholly avoid them, which in many cases might be effected without the least inconvenience or improperity.

It is well understood, that a small brace, judiciously made use of, may greatly augment the strength without adding to the weight of an implement; yet contrivances of this nature, which are obvious to the mere eye in mechanics, seem to be totally disregarded; far less do the constructors of such tools think of adopting many degrees of this description, which a very moderate degree of ingenuity might readily point out. The importance and advantages of having every part firm and compact in a tool which it is to be subjected to

5A
jolting and shaking, are universally recognized; yet, from the most trifling considerations, this principle may be seen departed from, and loads of superfluous materials added in vain to supply the defects that are in this way produced. And these remarks do not apply to one set or sort of implements only, but almost to every common tool or machine that is employed in the art of husbandry.

It is obvious, that these principles and circumstances, however evident in themselves, have not only been little attended to by the cultivators of the soil, but in a great measure overlooked by those who have been chiefly engaged in the making of tools of this description. It can scarcely have escaped observation that, in most of the districts of the country, though numerous useful tools and machines have been lately invented and improved, there are still various kinds to be met with, which are not only extremely inconvenient from their clumsiness, but employed with great disadvantage in consequence of their heaviness. A difference, however, in regard to strength, as well as other objects, becomes necessary sometimes from the nature of the situation and other circumstances, and by these the mechanism must frequently be directed in constructing these sorts of tools. And as implements of this kind are generally made use of by labourers who have but little knowledge of the nature, power, and operation of them, they should constantly be constructed on the most obvious and simple principles, as well as in such modes, and of such materials, as that they may be afforded at an easy rate; as where they are charged at a high price, it must of necessity operate greatly against their introduction into general use.

The descriptions of the several different implements and machines that are capable of being employed with advantage in the various departments of agriculture, may be seen under the different heads to which they properly belong.

**IMPLEX Action.** See **Action**.

**IMPLICATION, in Law,** is where the law doth imply something that is not declared between parties in their deeds and agreement; and when our law giveth any thing to a man, it giveth implicitly whatever is necessary for the enjoyment of the same. The want of words may be helped in some cases by implication; and if one word or thing, or one effect given, shall be implied by another; and there is an implication in wills and devises of land, whereby cestui que are created.

**IMPLICIT;** derived from in, and pecus, fold; something tacitly comprized, or understood; that is, contained in a discourse, clause, or proposition, not in express terms, but only by induction and consequence.

**IMPLICIT Faith.** See **Faith**.

**IMPLIED Condition, Contract, Malice, and Warranty.** See the substantives.

**IMPLIED Sound, in Music,** is a term used by Mr. Holder in his "Effay towards a rational System of Musick," p. 350. 362. 370. &c., to express what he thought to be the grave harmonic of certain sounds, but owing to a false rule by which he calculated, many of these are no such things as the Tartarim founds he supposed them to be, and many parts of the fanciful theory which he raises therefrom, are, as might be expected, at variance with all established facts and rules in harmonics. See our article **GRAVE HARMONIC** and **HOLDER'S TEMPERAMENT** of the musical scale.

**IMPLY a contradiction,** a phrase used among philosophers in speaking of the object of divine omnipotence. God can do everything that does not imply a contradiction proceeding from Him; by which is not meant a relation of the action to the executive power of God, but a relation to the other attributes and simple perfections of God.

**IMPOSSIBLE SUBSTANCES, in Chemistry.** Instead of considering repulsion as a general agency or force, philosophers, finding that the cause producing it is capable of being communicated from one body to another, and that some of the phenomena of its transition indicate it to be a distinct principle, have been disposed to regard it as a peculiar subtle kind of matter, the same with that to which the phenomena of heat have been referred, and which, in the modern chemical nomenclature, has been denominated Caloric, which fee. Though the materiality of this power has not been demonstrated, the supposition has much probability, and accords nearly with the phenomena. It may be regarded as the cause of repulsion, whatever be the nature of this power, whether it be regarded as a quality of bodies, a general force, or a distinct kind of matter; the same principle which produces the phenomena of heat is undoubtedly that which counteracts the attractions exerted between the particles of bodies. The connection of light and heat has led to the opinion of their identity; it is well ascertained that the particles of light are mutually repellent. From heat and light there is a natural transition to the agent which gives rise to the phenomena of Electricity and Galvanism, which fee. They all possefs one common character, which is that of not being subject to the attraction of gravitation, or at least their gravity is incapable of being appreciated; hence they are distinguished by the name of "imponderable substances." The possefs the greatest subtility or tenacity: we cannot easily influte or obtain them in a separate state of existence: they are observed only in flutes of combination, or in their rapid transition from one body to another; we can scarcely measure their force, and we are unable to trace their particular combinations, or confider them as essential constituent principles of any compound.

**IMPORTANCE of Action, in Poetry.** See **Action**.

**IMPORTATION, the act of importing or bringing merchandise from foreign countries, in contradistinction to exportation.**

**IMPOSITION of Hands, an ecclesiastical action, by which a bishop lays his hands on the head of a person, in ordination, confirmation, or in uttering a blessing.** This practice is also frequently observed by the Differenters at the ordination of their ministers, when all the ministers present place their hands on the head of him whom they are ordaining, while one of them prays for a blessing on him and his future labours. This same of them retain as an ancient practice, justified by the example of the apostles, when no extraordinary gifts were conveyed. However, they are not agreed as to the propriety of this ceremony; nor do they consider it as an essential part of ordination.

Imposition of hands was a Jewish ceremony, introduced, not by any divine authority, but by custom: it being the practice among those people, whenever they prayed to God for any person, to lay their hands on his head.

Our Saviour observed the same custom, both when he conferred his blessing on children, and when he cured the sick; adding prayer to the ceremony. The apostles likewise laid hands on those upon whom they bestowed the Holy Ghost. The priests observed the same custom when any one was received into their body. And the apostles themselves underwent the imposition of hands after, every time they entered upon any new design. In the ancient church, imposition of hands was even practiced on persons when they married, which custom the Abrahimians still observe.

But this term, which, in its original figurative, is general, is now restrained, by custom, to that imposition which is practiced at ordination. Spanheim has written a treatise "De Impoilione Manuum," and Tribenhorius and Brunius have done the same. See **Ordination**.
IMPOSSIBLE, that which is not possible, or which cannot be done or effected. A proposition is said to be impossible when it contains two ideas which mutually destroy each other, and which can neither be conceived, nor united together in the mind.

Thus it is impossible that a circle should be a square; because we conceive clearly, that squares and roundness destroy each other by the contrariety of their figure.

There are two kinds of impossibilities, physical and moral. Thus,

Physical impossibility, is that which is contrary to the laws of nature. A thing is morally impossible, when of its own nature it is possible, but yet is attended with such difficulties, as that, all things considered, it appears impossible.

Thus it is morally impossible, that all men should be virtuous; or that a man should throw the same number with three dice a hundred times successively.

A thing which is impossible in law, is the same with a thing impossible in nature: and if any thing in a bond or deed be impossible to be done, such deed, &c. is void.

21 Car. I. B. R.

IMPOSSIBLE Condition, in Law. See CONDITION.

IMPOSSIBLE Forms of Equations, in the Indeterminate Analysis, are those that will admit of no rational solution, such as

\[ 2x^2 + 3y^2 = z^2; \]
\[ 3x^2 + 7y^2 = z^2; \]
\[ 3x^2 + 7y^2 = z^2; \]&c.

Possible Forms.

\[
\begin{align*}
2n, & 2n + 1 \\
3n, & 3n + 1 \\
5n, & 5n + 1 \\
7n, & 7n + 1, 7n + 2, 7n + 4, 11n + 4 \\
11n, & 11n + 1, 11n + 4 \\
11n + 9, & 11n + 3
\end{align*}
\]

Now by means of these linear forms, we readily obtain those of the quadratic forms, such as

\[ 2x^2 + 3y^2 = z^2; \]

which is demonstrated to be impossible, as follows.

First, the three indeterminates \( x, y, \) and \( z \), may be considered as being prime to each other, for if they have any common measure, as \( x = 2x', y = 2y', \) and \( z = 2z', \) the whole equation may be divided by that common measure, and thus reduced to another, in which the indeterminates are prime to each other; and therefore an equation be possible, when the terms have a common measure, it is also possible when divided by it, and conversely if an equation be impossible when the terms are prime to each other, it is also impossible in all other cases. Assuming therefore, that in the equation \( 2x^2 + 3y^2 = z^2; \) \( x, y, \) and \( z, \) are prime to each other, we may proceed as follows. Whatever is the form of \( y^2; \) \( 3y^2 \) is divisible by \( 3, \) and is therefore of the form \( 3n; \) and \( x^2 \) must be of one of the forms \( 3n, \) or \( 3n + 1; \) these being the only possible forms of squares numbers to modulus \( 3. \) But if \( x \) be of the form \( 3n, \) we shall have \( 2(3n) = 3n = z', \) of the form \( 3n, \) that is, \( x, y, \) and \( z, \) are both of the form \( 3n, \) which is contrary to the supposition, since \( x, y, \) and \( z, \) are all prime to each other; therefore \( x^2 \) cannot be of the form \( 3n; \) let it then be of the form \( 3n + 1, \) and the equation becomes \( 2(3n + 1)^2 + 3n = z^2, \) of the form \( 3n + 2; \) but \( 3n + 2 \) is an impossible form for squares, therefore \( x^2 \) cannot be of the form \( 3n + 2, \) and consequently the proposed equation is impossible.

And we should have been led to the same result, if we had considered the equation under the more general form, \( (3p + 2)x^2 + 3qy^2 = z^2; \) that is, all equations falling under this form are impossible; hence all the following impossible equations are readily obtained.

\[
\begin{align*}
2x^2 + 3y^2 = & z^2 \\
5x^2 + 3y^2 = & z^2 \\
8x^2 + 3y^2 = & z^2 \\
11x^2 + 3y^2 = & z^2 \\
& \text{Impossible forms of equations.}
\end{align*}
\]

In the same way it may be demonstrated that the following equations are all impossible.

\[
\begin{align*}
(5p + 2)x^2 + 5qy^2 = & z^2 \\
(5p + 3)x^2 + 5qy^2 = & z^2 \\
(7p + 3)x^2 + 7qy^2 = & z^2 \\
(7p + 5)x^2 + 7qy^2 = & z^2 \\
(7p + 6)x^2 + 7qy^2 = & z^2
\end{align*}
\]

\[ 5 \text{ A 2, Thee} \]
These formula might be carried on indefinitely, each of which will furnish an infinite number of impossible forms of squares to each respective modulus; only observing that the indeterminate $q$ must always be prime to the modulus with which it enters.

The impossible forms for cubes are ascertained in a familiar manner, by first finding the linear forms of them, and then combining them in the foregoing case; thus all cubes are of one of the forms $7n$ or $7n + 1$, or $7n + 2$; that is, all cube numbers are either divisible by 7, or, when divided by it as far as possible, the remainder will be either 1 or 6; and hence again it follows, that $7n + 2, 7n + 3, 7n + 4, 7n + 5$ are all impossible forms of cube numbers; or if a number, when divided by 7, leaves for a remainder 2, 3, 4, or 5, that number is not a cube. Again, all cube numbers are of one of the forms $7n$, or $7n + 1$; and consequently, no number of the form $9n + 2, 9n + 3, 9n + 4, 9n + 5, 9n + 6, 9n + 7$, can be a cube, as there are all impossible forms.

The equation $2x^3 + 7y^3 = z^3$ is impossible.

Here, as in the case of squares, $x, y, z,$ may be considered as prime to each other; and, therefore, for the same reason as that stated in the foregoing demonstration, $x^3$ cannot be of the form $7n$, as we should then have $z$ of the same form, which is contrary to the hypothesis, these quantities being prime to each other; so that if the equation be possible, it must be when $x^3$ has one of the forms $7n + 1$, and this supposition gives $z$ of the form $7n + 2$, which is an impossible form for cube numbers; and therefore the equation $2x^3 + 7y^3 = z^3$ is impossible.

In the same way it may be shewn, that each of the following equations is impossible.

$$2x^3 + 7y^3 = z^3$$
$$3x^3 + 7y^3 = z^3$$
$$4x^3 + 7y^3 = z^3$$
$$5x^3 + 7y^3 = z^3$$
$$6x^3 + 7y^3 = z^3$$
$$7x^3 + 7y^3 = z^3$$

And these, again, may be farther generalized, by writing them

$$(7n + 2) x^3 + 7y^3 = (9n + 2) x^3 + 7y^3$$
$$(7n + 3) x^3 + 7y^3 = (9n + 3) x^3 + 7y^3$$
$$(7n + 4) x^3 + 7y^3 = (9n + 4) x^3 + 7y^3$$
$$(7n + 5) x^3 + 7y^3 = (9n + 5) x^3 + 7y^3$$
$$(7n + 6) x^3 + 7y^3 = (9n + 6) x^3 + 7y^3$$
$$(7n + 7) x^3 + 7y^3 = (9n + 7) x^3 + 7y^3$$

No one of which equations can ever become equal to a cube, either in integers or fractions; provided that $q$ be taken prime to the modulus with which it enters.

A similar mode of investigation may be pursued with all the higher powers, the only difficulty being in fixing upon a proper modulus; that is, such a number as hath the most impossible forms belonging to it, which requires a separate investigation. (See Power.)

Almost every power has some modulus that renders it expressible in three forms; thus,

<table>
<thead>
<tr>
<th>All powers are of one of the forms $7n$, or $7n + 1$</th>
<th>4th powers</th>
<th>4th powers</th>
<th>4th powers</th>
<th>4th powers</th>

</tr>
</tbody>
</table>

Here the 7th power is now omitted, not being reducible to a similar form; by means of these linear forms various others, as $a^7 + b^7 = c^7$, may be demonstrated to be impossible.

Defide these equations, which are demonstrable to be impossible, from the linear forms of the respective powers, there are others that have been noticed by Bachet, Fermat, Lagrange, Euler, &c.; but these generally require very laborious demonstrations, of which Euler has given several descriptions in the Petersburg Acts. "The Memoirs of Berlin also contain many papers on this subject by Lagrange; thus, $x^3 + y^3 = z^3$ is impossible, as also $x^4 + y^4 = z^4$, and various others; and generally, the equation $x^n + y^n = z^n$ is impossible, if $n$ be greater than 2. This proposition was first proposed by Fermat as a challenge to all the English mathematicians of his time, but the general demonstration of it was not published till very lately, viz. for November 1810, in Nicholson's Philosophical Journal, by Mr. P. Barlow, and to which the reader is referred for a complete investigation of this interesting numeral proposition. See also Barlow's "Elementary Investigations, &c."

**Impossible Roots of Equations.** See **Imaginary Roots.**

**Impossible Quantity, in Algebra.** See Root.

**IMPOST, from impone, I impose, in Law, properly denotes the tribute or tax appointed by a sovereign to be paid for such merchandise as is brought into any haven in his dominions from foreign nations. See Duty.**

**Impolt** is distinguished from **custom,** in that custom more properly signifies the duties paid to the king for goods shipped off or exported. But the two are frequently confounded together.

**IMPOSTHUME, by corruption from impostum and aposfym, obfega, a collection of matter, or put in any part of the body, either owing to an obstruction of the fluids in that part, which makes them change into such a matter; or to a translation of it from some other part where it was generated. See Ances.**

**IMPOSTORS, Religious, are such as falsely pretend to an extraordinary commision from heaven; and who terrify and abufe the people with false denunciations of judgments. These are punishable in the temporal courts with fine, imprisonment, and infamous corporal punishment. 1 Haw. P. C. 7.**

**IMPOSTS, in Architecture, the capitals of pillars, or pilasters, which support arches. See Bafle in Plate Architecture.**

An impost, sometimes also called chaprel, is a sort of little cornice, which crowns a pier, and supports the first floor, whence an arch or vault commences.

**Impolls conform to their proper orders. The Tuscan is a plinth only; the Doric has two faces crowned; the Ionic has a larimer over the two faces, and its mouldings may be carved; the Corinthian and Composite have a larimer, frieze, and other mouldings.**

The projection of the impost must not exceed the naked of the pilaster. Sometimes the entablature of the order serves for the impost of the arch; and this looks very grand and stately.

The impost is a thing essential to an orndans; inasmuch as without it, in the place where the curve line of the arch meets with the perpendicular line of the pillar, there always seems a kind of elbow. P. in figs. Bafle, represents an impost made open or flat in the middle, and bounded by fillets or gorge. This kind of impost is said to be the invention of lord Burlington. It may be called a Burlington impost. It is enriched with a guillo, or 6 bands
hands forming circles and intersecting each other: when there are two rows it is called a double fillet.

The following rules are given by some modern authors for dividing the imposts of arches: in the Tuscan imposts the facia hath 3 parts, the ogee 1, the fillet 3, the corona 3, and the band 1. For the projections, the facia 1, the ogee 2 parts, corona 3, and the whole 11. In the Doric, the frieze 2, fillet 2, atrafal 2, cyma recta 3, fillet 2, corona 2, ogee 1. For the projections, fillet 3, atrafal 1, corona 2, the whole 7.

In the Ionic, fillet 2, cyma 2, ovolo 1, corona 14, ogee 1. For the projections, cyma 12, corona 21, the whole 31.

In the Corinthian, the frieze 13, fillet 2, atrafal 2, cyma 21, ovolo 1, corona 12, ogee 1. For the projections, fillet 12, atrafal 6, cyma 13, corona 21, the whole 34.

IMPOTENCE is more particularly used to denote an inability in the male to impregnate the female. This inability, however, arises from two very different conditions of the body; in one of which the venereal congress cannot be accomplished; but, in the other, although coition be effected, the semen is not inflinitted into the uterus. Whence the noologists have properly distributed the varieties of this inability under two heads, or distinct diseases, viz. Anaphrodyia, or a defect of the vesical appetite and power, which is impotency strictly so called; and Dyspermatismus, or an impeded and interrupted emission of the semen in the generative act. The various mechanical impediments which constitute the latter species of the disease, have been enumerated under the proper head; and consist principally in disorders of the canal of the urethra, by which the passage is obstructed, or of the adjoining parts by which it is compressed; in each case, the exit of the seminal fluid is impeded, or altogether prevented.

The anaphrodiia, or incapability of coition, may originate from three causes; to wit, from a connate or original imperfection in the formation of the organs subservient to generation, a circumstance of very unusual occurrence; from a palsy affecting the muceuli erec tors of the penis (Anaphrodyia à paralysa, Sauvages, clav vi. genus xiii. spec. 1.); or from a too ready efflux of the semen, e.g., during the evacuation of the bowels, or at the commencement of the deflection of the virile organ (A. gonorrhoea, Sauv. spec. 2.) Where the disease consists in a malformation of the organs, or of any of their appendages, it must be of course beyond the reach of medical relief. When it originates from palsy, affecting the erector muscles, it is fearcely more favourable; since it is then only a part of a more general palsy affecting one side of the body (hemiplegia), or the lower extremities (paraplegia), or originating from injury to the spinal nerve, occasioned by falls or other external violence. When the complaint is occasioned by an extreme relaxation, as it were, of the secretory vessels, insomuch that the semen is poured out from the slightest irritation in their vicinity (such as the paffage of the stools, or the friction of the drefs), or from the smallest determination of blood to the parts before the deflection of the member is produced, medical treatment, with proper regimen, may be resorted to with success. This species of anaphrodiia has been ascribed to early maturition, to excess in venereal pleasures, and to the occurrence of frequent gonorrhoeas; but it cannot be doubted, that debasing quacks have multiplied-and exaggerated the representations of this kind beyond the truth, and that their books have done more harm than good, by the imaginary disorders with which they have affixed weak and hypochondriacal men. In such cases, the ordinary means of strengthening the body by light and nourishing diet, and by the use of the bark and steel, or other vegetable and mineral tonics, together with the use of the cold bath, must be resorted to. In many of those cases, Mr. Hunter observes, washing the penis, femur, and perineum with cold water, is often of service; and to render it colder than we find it at some feasons of the year, common salt may be added to it, and the parts washed when the salt is almost dissolved. Hunter on the Vén. Discur. pt. iii. chap. xii.

The able and distinguished physiologist just alluded to, remarked that the influence of the mind upon the operations of the body was most conspicuous in respect to this function, and that various states of apprehension, confusions of impurity, &c. sometimes altogether prevented the performance of it: the necessity, therefore, of investigating into the state of the mind, when impotency is complained of, was strongly pointed out by him from long observation, and illustrated by the following case: A gentleman consulted him respecting the loss of virility; but after some inquiry, Mr. Hunter found that the physical powers were not defective, and that it could only arise from a particular state of the mind, whereby the mind was to be applied to the cure; and Mr. Hunter assured him that he might be cured, if he could only rely on his own power of self-denial. The patient was requested, therefore, to sleep with the individual with whom his inability had manifested itself, having first promised him to abstain from any connection for six nights, let his inclinations and powers be what they might. This plan produced a complete alteration in the state of his mind, and was followed by a perfect and permanent cure. (Loc. cit.) See Dyspermatismus.

Impotency is a canonical disability to avoid marriage in the spiritual court. The marriage is not void ab initio, but voidable only by sentence of separation during the life of the parties.

IMPRacticABLE CASE, in Algebra. See Irredible.

IMPREcation, derived from in, and precor, I pray; a curse, or wish that some evil may befall any one.

The ancients had their goddeses called Imprccations, in Latin Dire, i.e., Deorum irae, who were supposed to be the executioners of evil conffences. They were called Dirae in heaven, Furies on earth, and Lamentides in hell. The Romans owned but three of these Imprccations, and the Greeks only two. They invoked them with prayers and pieces of verfe to delivery their enemies.

IMPREG nation, derived from impregnare, of pregnant, a woman with child; the emission of the seed of the male in coition, by which the female conceives, or becomes with young. See GENERATION.

Imprccation is also figuratively used in pharmacy, when a liquor imbibes the particles of some other body. Thus a menstruum is said to be impregnated with a body dissolved in it, as much as its pores are able to receive.

IMPREGnation, in Natural History, is one of the modes in which organized substances have become mineralized and preferved in the strata of the earth; Mr. William Martin, in his „Outlines,” p. 59, defines this term, as applying to the mechanical impregnation of organic substances with mineral matters, and he shews the diffcufions between this and a chemical union of mineral substances with the organic matter, called conversion.

IMPRESSED
IMPRESSED SPECIES. See SPECIES.

IMPRESSING, in the Sea Language. See MANNING the Fleet.

IMPRESSION, in Natural History, is a term implying the interior of the matrix or mould in which an extraneous fossil has been inclosed and its form impressed. The matrix is said to be filled when the reliquium remains in the impression, empty when the reliquium has been removed from the impression. Sometimes, after the organic body has been removed, mineral or inorganic matter takes its place, and assumes the external form of the reliquium, and such are often called casts, which is the state in which the fossil shells of a great number of shells are found. Mr. James Parkinson, in the commencement of his "Organic Remains," was inclined, vol. i. p. 57., to exclude impressions and casts from the rank of secondary fossils or organic remains, but the further researches of this able writer seem to have considerably modified his ideas on this subject.

IMPRESSION, in School Philosophy, it applied to the species of objects which are suppos’d to make some mark or impression on the senses, the mind, and the memory.

The Peripatetics tell us, that bodies emit species resembling them, which species are conveyed by the exterior senses to the common senso: these impressed species, being material and sensible, they say, are rendered intelligible by the active intellect; and when thus spiritualized, are called impressions, or express species, as being expressed from the other.

Impression is also frequently used in speaking of the editions of a book, or of the number of times it has been printed.

Impression, however, differs from edition: the former, properly speaking, takes in no more than what belongs to the printing, the letter, paper, margin, page, distances of words and lines, and the disposition of every thing that may have a good or bad effect upon the eye; the latter, besides all this, takes in the care of the editor, who has revised the copy, corrected or augmented it, adding notes, tables, and other like things, which he judged might contribute towards making the book more useful and correct.

Indeed, very frequently the word edition only refers to this latter part: as when, in speaking of the works of St. Augustine, we quote the edition of Eramus, the Lo- vanists, Benedictines, &c. where we have no regard to the printing part, but only to the care and pains of the editors.

Impression, Privilege for. See PRIVILEGE.

Impressions on gems and medals. See GEMS AND MEDALS.

IMPREST, Auditors of. See AUDITORS.

IMPRISONMENT, the state of a person restrained of his liberty, and detained under the custody of another; and extends not only to a gaol, but to a house, rocks, or a man’s being held in the street, &c. (2 Inst. 589.) None shall be imprisoned but by the lawful judgment of his peers, or by the law of the land. Mag. Ch. 9 Hen. III. c. 2. 25 Edw. III. Stat. 5. c. 4.

No person is to be imprisoned, but as the law directs, either by the command or order of a court of record, or by lawful warrant, which warrant must be in writing, under the hand and seal of the magistrate, and expressing the cause of the commitment, in order to be examined (if necessary) upon a “habeas corpus;” or the king’s process, on which one may be lawfully detained; and at common law a person could not be imprisoned unless he were guilty of some force or violence, for which his body was subject to imprisonment, as one of the highest executions. Where the law gives power to imprison, in such case it is justifiable, provided he that does it in pursuance of a statute, exactly purifies the statute in the manner of doing it, for otherwise it will be deemed false imprisonment, and in consequence it is unjustifiable. Every warrant of commitment for imprisoning a person, ought to run, “Till delivered by due course of law,” and not “Until further order,” which has been held ill, and thus it also is, where one is imprisoned on a warrant, not mentioning any cause for which he is committed. If there he no cause expressed, the gaoler is not bound to detain the prisoner. For the law judges in this respect, faith for Edward Coke, like Felix the Roman governor; that it is unnecessary to send a prisoner, and not to signify within the crimes alleged against him.

A person being sent to prison by a warrant from a Secretary of State, without alleging any cause, &c. it was adjudged, that he ought to be discharged for that reason. Persons may also, by bail or habeas corpus, be discharged from their imprisonment in any case bailable. See the articles HABEAS CORPUS, BAIL, PRISON, PRISONER, and GAOL.

IMPRISONMENT, False. See FALSE and APPEAL.

IMPROMTU. See IMPROMTU.

IMPROPER FEUDS, in Law. See FEUD.

IMPROPER FRACTIONS, in Arithmetic. See FRACTIONS.

IMPROPRIATION is a term used where the profits of an ecclesiastical benefice are in the hands of a layman.

In which sense it stands distinguished from appropriation, which is where the profits of a benefice are in the hands of a bishop, college, &c. though the two are now often used promiscuously. There are said to be 3845 imprisonments in England.

IMPROPRIETY, the quality of something that is not fit, or proper. See PROPER, and PROPRIETY.

Grammarians observe three kinds of faults against purity in language; a solecism, barbarism, and impropriety: an impropriety is committed when a word is used that has not a proper signification.

This is an offence against lexicography, as barbarism respects etymology and the solecism syntax. It is the business of the lexicographer to assign to every word of the language the precise meaning or meanings which use hath alligned to it. This fault may be committed either in single words or in phrases. Improprieties as to single words are such as a writer is apt unwarily to be seduced into by some resemblance or proximity in sound or sense, or both. It is by proximity in sound that several are misled to use the word “observation” for “obsequious,” as when they speak of the religious observation of a festival for the religious observance of it. By a similar mistake “endurance” hath been used for “duration,” and confounded with it; whereas its proper sense is patience. This was the case in the days of queen Elizabeth, when endurance was synonymous with duration, though in this acceptance it is now obsolete. Thus also the human and humane are sometimes confused; the adjectives “ceremonial” and “ceremonious” are sometimes used promiscuously; and the word “construcion” is variously applied, &c. &c. With regard to improprieties arising from a similarity in sound, we may mention “veracity,” strictly applicable to persons, used for “reality,” which pertains to things; “verdict” used for “testimony;” “fible” for “ridiculous,” &c. &c. To this class we may refer the “idiotism,” or the employing of an English word in a sense which it bears in some provincial dialect, in low and partial use, and which perhaps the corresponding word bears in some foreign tongue; unsupported by general use in our own
own language; such are "impracticable," when it is used for "impossible," and applied to roads; "intend" when used for "mean," "decompound" for "analyze," &c. &c. Another error of the same kind is the "latinism;" such as the use of the word "affection," when applied to things inanimate, and signifying the state of being affected by any cause; and "integrity" when used for "entireness." To these properly succeeds that fort of the "vulgarism" in which only a low and partial use can be pleaded in support of the application that is made of a particular word. Of this an example occurs in the following passage cited from the "Guardian" (N. 57) "Tis my humble request you will be particular in speaking to (for on) the following points." Of the same kind is "on" for "of." The derivatives, "falsehood," "falsity," "falseness," from the root "false," are often erroneously applied for one another, though they ought to be distinguished. "Falsehood" is properly used in a moral sense for want of veracity, and applied only to persons; the other two are applied only to things. "Falsity" denotes that quality in the abstract, which may be defined contrariness to truth. "Falsehood" is an untrue assertion. The same misapplication occurs in the use of the word "confidence" for "conscienceless."

Of improperities that occur in phrases the first we shall mention, when the expression, on being grammatically analyzed, is discovered to contain some incongruity, such is the phrase "all other things" after the superlative; e. g. "the most perfect of all others," should have been "more perfect than any other," or "the most perfect of all" the things to which it refers. To these evils belong those improperities which involve in them some absurdity. Others are those by which an author is made to say one thing when he means another. Another species of improperity is that in which there appears some slight incongruity in the combination of the words; e. g. "you fall into a man's conversation," &c.; for "fall into conversation with a man":—"the false taste the town in," &c.; for the "false taste of the town." Campbell's Philosophy of Rhetoric, vol. i. p. 456, &c.

IMPROVEMENT, in Agriculture, a term applied to any fort of amelioration which is produced on lands either by the several different operations and processes which they are capable of admitting, or by the general practices of cultivation. See DRAINING and WATCHING, &c.

IMPROVEMENT of Landed Property, the art of rendering it more valuable to the proprietors, and at the same time more beneficial to the public. It has been well remarked that the possessors of this fort of property, "have a double interest, a two-fold motive to incline them toward the improvement of their estates; namely, to augment their personal incomes, and to increase the prosperity of the land they live in."

The species of improvements that landed property is capable of admitting, are considered as very numerous; but they may probably be arranged under the following heads.

1. Reclaiming watery lands.
2. Appropriating commonable lands.
3. Confinating appropriated lands.
4. Laying out estates.
5. Laying out farm-lands.
7. Improving farm-lands.
8. Improving wood-lands.
9. Improving waters.
10. Improving mines, quarries, &c.

The last of these objects may in most cases be effected by proper draining and embanking, the second by inclosure, the third by means of exchange, purchase, or sale; and the whole of the rest by the several methods that are described under the particular heads to which they immediately belong. See DRAINING, EMBANKING, COMMONABLE LANDS, &c.

It is suggested, that by the political constitution of this country the government has no power or legal means of advancing its prosperity by the improvement of appropriated territory; unless by special acts of the legislature. And that even these are confined to a few particular objects; as drainage, inclosure, and the consolidation of intermixed lands; and these only, where a plurality of interests are concerned. In the mass of improvements which are here to be brought forward, and in all cases of private property, it is out of the power of the public to interfere. A proprietor may suffer his estate to lie waste with impunity, provided he thereby injures no other man's private property. And if an estate be permitted to lie partially waste, or under - produce, for the want of due improvement, the loss to the public, though not so large, is of the self-same nature. In the appropriation of a wild uncultivated country, it is hinted, that it might be wise in a government to reserve a power of rendering its lands productive, as a wife poifferor of an estate reserves the right of keeping his farms in tenantable repair and husband-like cultivation at the expense of the tenant who refutes or neglects to perform his duty. But as no such reservation has been made, nor in any way claimed in this country, the proprietors of its lands are, it is supposed, only by the ties of interest, but by those of honour, to promote their improvement.

It is considered that the basis or ground-work of improvement on which a practical man may tread with safety and full effect, is an accurate delineation of the existing state, together with a faithful delineate of the present value of the lands and other valuable particulars of an estate to be improved. A general map of the appropriated lands, promptly exhibiting the several farms and fields as they lie, and showing the existing watercourses, embankments, fences, and buildings, the woodlands, flatting waters, morasses, and moomy grounds; the known mines and quarries, together with the commonable lands, if any, belonging to the estate, forms a comprehensive and useful subject to the practical improver. It is to him, what the map of a country is to a traveller, or a sea-chart to a navigator. If an estate is large, a faithful delineation of it will enable him to fix in a few hours to feel out with advantages reflecting the connections and dependencies of the whole and its several parts, wihich as many days, weeks, or months could not furnish him, without such scientific assistance. If, on the issue plan, the rental value of each mine, quarry, woodland, and productive water in its present state be stated, the preparatory information which science is capable of furnishing may be considered as complete. And it remains with the artificer to study, with persevering attention, the subject himself, in order to discover the species of improvements of which it is susceptible, and the feasible methods of carrying them into execution. See Landed Property.

IMPROVIDE, in Law. See Qui Improvide.

IMPROVISARE, Ital. to sing or play extempore.

IMPROVISATORE, Ital. an extemporaneous singer or verses upon a given subject. A voluntary player, an organist who is able to treat in a masterly manner a given subject of fugue, extempore, is justly allowed to be a man of considerable abilities.

The improvisatori, in poetry, seem confined to the southern provinces of Europe. Italy, Spain, and Portugal, appear exclusively to enjoy the gift. It is indeed unwillingly credited elsewhere. And yet there is nothing more com-
Thus the justice of Jesus Christ is said to be imputed to us; his merits, and the price of his sufferings, being applied to us.

IN, in the Message. — To put a horse IN, is an expression that signifies to breed and dress him, by putting him right upon the hand and the heels.

IN, in the Sea Language, denotes the state of any of a ship’s falls, when they are furled or flowed: it is used in opposition to out, which implies that they are set, or extended to affilit the ship’s course.

IN-penny and out-penny, in our Old Writers, money paid by the custom of some manors on the alienation of tenants, &c. — In-penny and out-penny "confutudo tale sib in villa de Earl Radham, de omnibus terris que infra Burgadium tenentar, viz. quod ipse, qui vendiderit diem tenuram aliquam, debit pro exitu suo de cadem tenura unum denarium, & simile de ingressu alterius; et si praedi-derit denarii a retro fuerint, nullius domini diilirgent pro eodem denariis in cadem tenura." Regill. Prior. de Cokesford, p. 25.

IN and Out, in Ship Building, is a term often used to signify the shelling of the timbers the moulding way, but more generally applied to the blocks which connect the sides of the ship together by being driven the thwathship way through the knees, riders, &c.

INA, in Biography, king of Wessex, one of the most illustrious princes of the Saxon heptarchy, succeeded to the crown in 689, and began his course by attempts at extending his dominions by force of arms. He invaded Kent, but was induced by a large sum of money to desist from his enterprise. He then obtained possession of Cornwall and Somersetshire, which he annexed to his kingdom, treating the vanquished with a degree of humanity hitherto but little practised by the Saxon conquerors. By his code of laws he is placed as a legislator at the head of the Saxon kings previously to Alfred. Though he was disturbed by some insurrections at home, his long reign of thirty-seven years may be regarded as one of the most glorious and most prosperous of the heptarchy. In the decline of his he made a pilgrimage to Rome, and after his return shut himself up in a cloister, where he died. Home.

INA, in Geography, a town of Japan, in the island of Ni-phon; 22 miles N.W. of Fanilima.

INACCESSIBLE Height or Distance. See ALTITUDE, DISTANCE, &c.

INACCESSIBLE Island, in Geography, a small island in the South Atlantic ocean, and one of those called the islands of Trinid de Cuhua. It has obtained the name from its being a high, bluff, apparently barren plain, visible at the distance of 14 or 15 leagues, about nine miles in circumference, and having on the whole a very forbidding appearance; with a high rock detached from it at the south end. S. lat. 37° 16’. W. long. 11° 59’.

INAULCHIA, Inaus, in Antiquity, a festival in Crete, celebrated in honour of Leucothoé, or Izo. The word is compounded of Ino, and ιναύς, i.e. grief; being, perhaps, a commemoration of Ino’s misfortunes.

INACORI, in Geography, a town of Hindostan, in Marawar; 20 miles N.W. of Ramanadapour.

INACTION, effulsion of action, a term much used in the mystical divinity; by which is understood a privation, or annihilation of all the faculties; whereby the door is, as it were, shut to all external objects, and a kind of echacy is procured, during which God speaks immediately to the heart. It is the state of inaction that is held the most proper for receiving the Holy Spirit; and in this state of doing, they say,
Inactivity of Matter. See Vis Inertia.

Inadequate Idea, or notion, is a partial or incomplete representation to the mind. See Idea.

Inagua, or Yanagua, in Geography, two islands of the West Indies, near the N.W. coast of St. Domingo, N.lat. 21° 2′ to 20° 26′, W.long. 72° 50′ to 71° 30′.

Inaja Guacura, in Botany, a name by which some authors have called the cocoa-nut tree, or palma indiaca nucifera, of other writers.

Inaka, in Geography, a town of Japan, in the island of Nippon; 150 miles W. of Mexico.

Inalienable, that which cannot be validly alienated, or made over to another. See Alienation.

Thus the dominions of the king, the church, minors, &c. are inalienable, otherwise than with a reserve of the right of redemption for ever.

Inamblucia, in Natural History, the name of a genus of foifs of the class of the scelentes; but of the number of the columnar, not the rhomboidal kinds, and composed merely of parallel fibres. See Selentes.

Inamelling, or Enamelling. See Enamelling.

Inanimate, derived from in, taken privatively, and anima, soul, denotes a body that has either lost its soul, or that is not of a nature capable of having any.

Thus a dead man is an inanimate lump, and metals are inanimate bodies.

Inanition, in Medicine, emaciations, or that state of the stomach when it has been too long deprived of food.

Man, as well as many other animals, is capable of subsisting for a considerable length of time without food. But, in this case, among other effects of inanition, such as languor, debility, &c., the most remarkable consequence which ensues, is the extreme irritability of the stomach itself, which is now easily excited to extraordinary vascular action, by the smallest quantity of food or drink, so that it is difficult to avoid occasioning inflammation of that organ, in attempting to restore the health and strength of the sufferer. This law of the vital power, (excitability, or fehnial power, in the language of Brown and Darwin,) is the ground-work of the yeftems of medicine promulgated by these two physicians; namely, that whenever the accustomed stimulus of any organ, or of the body at large, has been long withdrawn, such an accumulation of that power takes place, that a much smaller stimulus than ordinary is capable of producing extraordinary excitation. (See Excitability.) In such cases, therefore, the utmost caution is required to restore the natural stimulus by slow degrees; using first substances of the least stimulating power, and in very small quantity. Thus in a frost-bitten limb, which is produced by the too great abstraction of the stimulus of heat, the attempt to restore its

Vol. XVIII.

Inactivity by warm applications is invariably productive of inflammation and gangrene, and the limb will drop off, if the life of the patient be not also destroyed. The only successful mode of restoration is to rub the part with snow, or with cold water, which are of a temperature something above the cold of the limb. (See Cold.) In like manner, in the attempt to restore a person to strength, who has suffered from inanition, the first nutrient given must be fluid, that it may not irritate by its hardnefs and weight, in small quantity, for a similar reason, defirute of every heating and stimulating quality, from visous, spirituous, or aromatic substances, and very easy of digestion, or containing no inert, so that the action of the stomach may not be too much excited for accomplishing the digestive processes. Hence in extreme cases, a spoonful of milk and water, or milk alone, to be repeated every hour, would be one of the safest and most effectual remedies; and by slow and cautious steps, nutrient of a more substantial kind, and more copious in quantity, might be afterwards referred to, attending rather to the wants of the stomach, than to the flated hours of meals.

Inanity, the school term for empty thoughts, or absolute vacuity, and implies the absence of all body and matter whatsoever, so that nothing remains but mere space.

Inarching, in Gardening, a particular sort of grafting, called also by some grafting by approach. It is used when the stock intended to be grafted on, and the tree from which the graft is to be taken, stand so near one another, that they may be brought to touch. The branch to be inarched is to be fitted to that part of the stock where it is to be joined, the rind and wood are to be pared away on one side for the length of three inches, and the stock or branch where the graft is to be united is to be served in the same manner, so that the two may join equally together, and the sap meet; a little tongue is then to be cut upwards in the graft, and a notch made in the stock to admit it, so that when they are joined, the tongue will prevent their slipping, and the graft will more closely unite to the stock. Having thus brought them exactly together, they may be tied with some baiis or worsted, or other soft tying, and then the place must be covered with some grafting clay, to prevent the air from drying the wound, and the wet from rotting the stock; a stake must be fixed in the ground, to which both the stock and the graft must be tied, to prevent the wind's displacing them. When they have remained in this state four months they will sufficiently united, and the graft may then be cut off from the mother-tree, observing to slope it close to the stock, and at this time there should be fresh clay laid all round the part. This operation should be performed in April or May, that the graft may be perfectly united to the stock, before the ensuing winter. It is principally practised upon oranges, myrtles, jessamines, walnuts, and firs, and some other trees, which do not succeed well in the common way of grafting. But it is a wrong practice when orange trees are designed to grow large, for these are seldom long-lived after the operation. See Articulation and Grafting.

Inarticulate, an epithet applied to such sounds, syllables, or words, as are not pronounced distinctly. See Articulation.

Inauguration, the coronation of an emperor, or king; or the consecration of a prelate, so called in imitation of the ceremonies used by the Romans, when they were received into the college of augurs. See Crown, King, and Bishop.
The word comes from the Latin *inaugurare*, which signifies to dedicate a temple, or to raise any one to the priesthood, having, in order to that, first taken auguries. See Augur, and August.

IMBATZKOI Novimski, in Geography, a town of Russia, in the government of Tobolsk, on the Enisei; 124 miles S. of Turuchansk. N. lat. 63° 40'. E. long. 89° 14'.

IMBATZKOI Verchov, a town of Russia, in the government of Tobolsk; 168 miles S. of Turuchansk.

IN-BOARD, a term used to signify any thing that is within the ship; as the in-board works are all designed on a drawing so called, &c.

INCA, or YNCA, an appellation which the natives of Peru give to their kings and princes of the blood.

The chronicle of Peru relates the origin of the Incas: this country had been a long time the theatre of all sorts of wars, horrible crimes, and dissensions, till at length there appeared two brothers, the one of whom was called Manco-capac; of this person the Indians used to tell wonders: they say he built the city of Cuzco, settled laws and policy, and taught them to adore the sun; and he and his descendants took the name of Inca, which, in the language of Peru, signifies king, or great lord. These Incas grew so powerful, that they made themselves masters of the whole country, from Chili to Quito, establishing in every province their peculiar policy and religious institutions, and held it till the divisions between the brothers Huascar and Atahualpa; which the Spaniards under Pizarro laying hold of, made themselves masters of Peru, and put an end to the empire of the Incas, in 1535. They number only twelve of these Incas. It is said, the most considerable among the nobles in the country still bear the name of Inca.

INCALESCE, compounded of in, and calceo, or calco, I grow warm, the growing hot of any thing, either by motion and friction, or as quick-time done by pouring water on it.

INCALESCENT MERCURY, a name given Mr. Boyle to some mercuries of an uncommon preparation; which, by being mingled with a due proportion of gold-leaves, or small filings, would amalgamate and grow hot with the said.

INCAmerATION, derived from in, and camera, chamber, in the apothecary's chamber, the union of some land, right or revenue, to the domains of the pope. See Chamber.

INCAntATION, derived from the Latin in, and canto, I sing, (see Charm, and Carnary) incantamento; words and ceremonies used by magicians to raise devils; or rather to impose on the credulity of the people. See ConJuraTion, Fascination, Magic, Witchcraft, &c.

INCAPACITY, in matters of benefices, among the canonists, is of two kinds; the one renders the provision of a benefice null in its original; the other is accurs, and annuls the provisions which at first were valid.

Incapacities of the first kind, are the want of a dispensation for age in a minor, for legitimation in a bastard, for naturalization in a foreigner, &c.

Of the latter kind, are grievous offences and crimes: as being concerned in seeing a sentence of death executed, &c. which, they decreed, vacate the benefice to all intents, or render the holding it irregular.

INCARCERATION, in Geography, a town of Paraguay; 360 miles S. of Assumption.—Also, a town of New Navarre; 18 miles W. of Cafa Grande.

INCARNA†ION, in Theology, signifies the act whereby the Son of God assumed the human nature; or the mystery by which Jesus Christ was made man, in order to accomplish the work of our salvation. The era used among Christians, whence they number their years, is the time of the incarnation, that is, of Christ's conception in the virgin's womb.

This era was first established by Dionysius Exiguus, about the beginning of the sixth century, till which time the era of Diocleian had been in use.

Some time after this, it was considered, that the years of a man's life were not numbered from the time of his conception, but from that of his birth; which occasioned them to postpone the beginning of this era for the space of one year, retaining the cycle of Dionysius entire in every thing else.

At Rome they reckon the years from the incarnation, or birth of Christ, that is, from the 25th of December, which custom has obtained from the year 1451. In France, and several other countries, they also reckon from the incarnation: but then they differ from each other in the day of the incarnation, fixing it after the primitive manner, not to the day of the birth, but conception of our Saviour. Though the Florentines retain the day of the birth, and begin their year from Christmas. See Petav, de Doct. Temp. Grandamicus de Dei Nat. See Aera and Epocha.

INCARNA†IVE, an epistle in Surgery, applied to such medicines as tend to promote the precursor, by which wounds and ulcers become filled up with granulations.

INCARNA†IVE Bandage. See Bandage.

INCARNA†IVE Suture. See Suture.

INCENDA†DA de Barragan, in Geography, a town of South America, situated on the W. bank of the Barragan, at its union with the Plata. The houses are irregularly built, and the inhabitants are generally indolent and poor; 21 miles W. of Buenos Ayres.

INCE†DIARY, INCENDIARIES, in Law, is applied to one who is guilty of maliciously setting fire to another's dwelling-houses, and all out-houses that are parcel thereof, though not contiguous to it, nor under the same roof, as barns and stables. A bare intent, or attempt to do this by actually setting fire to a house, unless it absolutely burns, does not fall within the description of incendi et comburrit. But the burning and consuming of any part is sufficient, though the fire be afterwards extinguished. It must also be a malicious burning; otherwise it is only a trespass. This offence is called arson in our law.

Among the ancients, criminals of this kind were to be burnt. "Qui seธ acerberique frumenti juxta domum potum fecerit, prudensque dolo malo combustorit, violent igni necatur," See Arson. See also Black-aff and Fireshocks.

INCENSE, from incendium, q. d. burnt; as taking the effect for the thing itself; an aromatic, odoriferous resin, otherwise called frankincense.

INCE†PTIVE, a word used by Dr. Wallis, to express such moments, or first principles, which, though of no magnitude themselves, are yet capable of producing such as are. See INFINITe, and INSI†DEFINe†BLE.

Thus a point has no magnitude itself, but is inceptive of a line which it produces by its motion. So a line, though it have no breadth, is yet inceptive of breadth; that is, it is capable, by its motion, of producing a surface which has breadth, &c.

INCERATION, in the Materia Medica, the mixing of liquids with something that is dry, by a gentle soaking, till the
the composition be brought to a sufficiency of the confidence of soft wax.

1. INCERTAINTY, in Law, is where a thing is so ambiguously fet down, that the plain meaning cannot be under-
flood; and this is said to be the mother of contention. The questions of incertitude arising sometimes on matter of record, as writs, counts, pleas, verdicts, &c. and sometimes on deeds or writings, or upon contracts, &c. (5 Rep. 121. Plowd. 25.) In law proceedings, incertitude will make them void; for all proceedings in law are to be certain and affirmative; but the defendant may be at a certainty as to what he should answer, &c. (Plowd. 84.) If the court and verdict in an appeal be uncertain, there can be no judgment given thereon; and it is the same on an indictment. (3 Mod. 121.) Incertitude in deeds renders them void; but sometimes a term for years granted by lease, may be made certain by reference to certainty; and incertitude may be reduced to certainty by matter, ex fud faits, implication, &c. (Plowd. 573. 6 Rep. 29.) If there are two men of one name, and a devise of lands, &c. is to one of that name, without any distinction, it will be void for incertitude; though perhaps an averment may make it good. (2 Bul- frodre, 180.) Incertitude in declarations of uses, of lives of lands, &c. is rejected in law; for otherwise there would be no certain inheritances. 9 Rep.

2. INCEST, the crime of venereal commerce between per-
sons who are related in a degree prohibited marriage by the laws of the country.

Some are of opinion, that marriage ought to be permitted between kinsfolk, to the end that the affection, so necessary in marriage, might be heightened by this double tie; and yet the rules of the church have formerly extended this prohibition even to the seventh degree, but time has now brought it down to the third or fourth degree. See Mar-
rriage.

Most nations look on incest with horror, Persia and Egypt alone excepted. In the history of the ancient kings of those countries we meet with intimations of the brother's marrying the sister: the reason was, because they thought it too mean to join in alliance with their own subjects: and still more so to have married into the families of any foreign princes.

As to the Persians, there was a still more abominable sort of incest practised by their magi: if we may trust Cato, the son of the firft, 91.

"Nam magus ex mater & gnato signatur opercor, 
Si vera et Perfarum impia religia."

In 1645, incest and wilful adultery were made capital crimes; but at the Restoration it was not thought proper to renew a law of such unfashionable rigour; and these offences have been ever since left to the feeble coercion of the spiritual court, according to the rules of the canon law.

incest, Spiritual, is the like crime committed between two persons who have a spiritual alliance, by means of bap-
tism or confirmation.

incest, Spiritual, is also underlaid of a vicar, or other beneficiary, who enjoys both the mother and the daughter; that is, holds two benefices, the one whereof depends on the collation of the other.

Such a spiritual incest renders both the one and the other of those benefices void.

incestuous, the name of a fea or hereby, which arose in Italy about the year 1065.

The hereby of the Incestuous had its beginning at Ravenna; the learned of which place, being consulted by the Florentines about the degrees of affinity which prohibit marriage, made answer, that the seventh generation, mentioned in the canons, was to be taken on both sides together; so that four generations were to be reckoned on one side, and three on the other.

They proved this their opinion by a passage in Justinian's Institutes, where it is said, that a man may marry his brother's or sister's grand-grand-daughter, though this be but in the fourth degree: whence they concluded, that if my brother's grand-child be in the fourth degree with respect to me, the is in the fifth with respect to my son, in the sixth with respect to my grandson, and in the seventh with respect to my great grandson.

Peter Damian wrote against this opinion, and pope Alex-
ander II. condemned it in a council held at Rome.

INCH, a measure of length, in China, is $\frac{1}{11}$ th of the Chi-
inese foot = 10 fen = 100 li = 100 hao.

INCH, English linear, $\frac{1}{11}$ th of an English foot = 1 inches or finger's breadth = 3 barley-corns = 48 hair's breadths = $\frac{1}{11}$ th English yard = .0325 meter pouces of France = .0259918 metres of the new measures = 1626256 links.

INCH, English square or superficial, is $\frac{1}{11}$ th, or .0064444 square feet = .000644444 square metres of the new meausures of France = .0149225 square links.

INCH, English cubic or solid, is $\frac{1}{11}$ th, or .00078704 cubic feet = .000163713 cubic metres of the new measures of France = .0020129 cubic links.

INCH, French, of length, or pouce of the old measures of France, was $\frac{1}{11}$ th of the Paris foot = 12 lines = 1.0957 English inches = .07250127 metres of the new measures = 1.2454 meters links.

INCH, Scots, of length, is $\frac{1}{11}$ th English inches = 0.2345054 = 4 inches foot = 1.139 in Geography, an inch in the yard called Lough Swilly, in the country of Donegal, Ireland. It is very fer-
tile, and contains about 2000 acres. Its land and the adjoining shores are high, with cultivation spreading over them, and little clutters of cabins with groups of wood. The water is of great depth, and a safe harbour for any number of ships. Inch was the great resort of the Lough Swilly herring fishery, which at one time employed 500 boats, and afforded subsistence to a great number of people. A large sitting house with necessary store rooms was built in the island, but the profits of the fishery have declined.

INCH, a town of Scotland, in the county of Aberdeenshire, 10 miles N.W. of Inverary.

INCH-Castle, an island of Scotland, in Loch-Lomond, on which are the remains of a conveental church.

INCH, a small island of Scotland, on the northern side of the Frith, anciently called Amin; on which are the ruins of a celebrated abbey of Augustine monks, founded about the year 1125, by Alexander I. king of Scot-
land, who was thrown upon it by a tempest, in gratitude for his escape, and dedicated to St. Columba. It was pillaged by the fleet of Edward III. of England, when he invaded Scotland. Some ruins still remain. N. lat. 56° 3'. W. long. 3° 18'.

INCH-Gareis, a small island in the Forth, opposite to Queensferry, fortified with cannon to defend the river.

INCH-Keith, a small island of Scotland, in the Frith of Forth; so called from the name of a brave hero who fought valiantly against the Danes in 1010, to whom it was granted; 12 miles E.S.E. of Dumfries. N. lat. 56° 3'. W. long. 3° 9'.

INCH-Kenneth, a small island near the W. coast of Mull. N. lat. 56° 29'. W. long. 6° 10'.

INCH-Marnoch, a small island, about a mile in extent, near the W. coast of the isle of Bute; it has 120 acres of arable land,
INC

land, 40 of brushtwood, nearly 200 of moor, together with flats of coral and shells on the W. side.

Inciu-Murrin, an island in Loch-Lomond, two miles long, which is converted into a deer-park. On it are the remains of a manor, belonging to the family of Lenox.

Inch-Point, a cape of Ireland, between Dingle bay and Cattlemann harbour, in the county of Kerry; 13 miles E. from Dingle.

Inch of Cavel's, a manner of selling goods among merchants. The name of it is thus: Notice is usually given upon the Exchange in writing and elsewhere, when the sale is to begin; against which time the goods are divided into several parcels, called lots, and papers printed of the quantity of each, and of the conditions of sale; as, that none should bid less than a certain sum more than another had bid before. During the time of the building a small piece, of about an inch, of wax-candle, is burning; and the last bidder, when the candle goes out, has the lot or parcel exposed to sale.

INCHASING, in Sculpture. See Engraving.

INCHIGELLA, in Geography, a small town of the county of Cork, province of Munster, Ireland, near the source of the river Lee, over which it has a bridge. It is situated in a wild mountainous country, and is a very poor place. It is eight miles W.S.W. from Macroom, and 24 W. from Cork.

INCHIN, a small island in the Pacific ocean, near the coast of Chili. S. lat. 45° 40'.

INCOHATIVE, a term signifying the beginning of a thing, or action; the same with what is otherwise called incipit.

INCOHATIVE verbs denote, according to Príncian and other grammarians, verbs that are characterized by the termination for or for, added to their primitives; as angus, from euergo, calceo, from calce, dulceo, from dulcis, incrate, from ira, &c.

INCOFFER, Melchior, in Biography, a learned German, was born at Vienna in 1584. Having laid the foundation of a learned education, he applied himself to the study of the law, and became a distinguished proficient in it at the age of 23. He then quitted it, and entered himself among the Jesuits, went to Rome and employed his time in the study of philosophy, theology, and mathematics. Shortly after this he was called to fill the chair of professor in those faculties, during several years at Messina, in Sicily. In 1650 he published a book entitled "The Virgin Mary's Letter to the People of Messina proved to be genuine." Complaints were preferred against him before the congregation of the "Index" at Rome, on account of this publication. He immediately repaired to the city, vindicated himself, and was allowed to reprint his work, with a small alteration in the title. He died at Milan in 1648, when he was about 64 years of age. Having received some injuries from his brethren, he wrote a satire against them, which was printed after his death under the title of "Monarchia Solidorum." Incoffer was author also of "Tractatus Syllepticus, in quo quid de Terra Solida motu, vel flato secundum Sacram Scripturam et S.S. Patrum fentient, &c. Ollendorfl, 1633;" "De faccia Latinitate, de variis Lingue Latine mysteriis, ex Origine, Pragraphia, Fine," &c.; "Historie trium Magorum;" likewise the first volume of a work entitled "Annumurium Ecclesialitorum Regni Hungariae," which is said to have exhibited such proofs of critical skill and deep research, as occasioned regret that the author did not live to complete his plan.

INCHTURE, in Geography, a town of Scotland, in the county of Perth, on the road between Perth and Dunedee; 9 miles E. of Perth.

INCIDE, in Medicine, to cut, whence also the adjective incised, obsolete terms, applied to certain articles of the materia medica, to denote the action and quality by which certain fluids are detached from the parts to which they adhere, by an operation which has been conceived analogous to cutting with a sharp instrument, probably from the peculiar sensation which they excite. These incises are principally acids, alkalis, or neutral salts, the action of which upon the palate, and other sensitive parts, is, from the same analogy, called sharp. Hence also, in popular language, we speak of cutting the phlegm, &c. But this action is principally a chemical combination of the means (as in the case of sore throat), which then loses its adhesive qualities, and is easily rejected; and not a mechanical division of the particles, by means of the pointed and sharp atoms of those acid and alkaline matters, as the original employers of the term imagined.

INCIDE, in Mechanics, expresses the direction in which one body strikes on another; otherwise called inclination.

In the incursions of two moving bodies, their incidence is said to be perpendicular or oblique, as their directions or lines of motion make a straight line, or an oblique angle at the point of contact.

INCIDE, Angle of, commonly denotes the angle comprehended between an incident ray, or other body, and a perpendicular to the plane in the point of incidence.

Thus, supposing A B (Plate I. Optics, fig. 3) an incident ray proceeding from the radiant point A, to B the point of incidence, and H B a perpendicular to D E in the point of incidence, the angle A B H, comprehended between A B and H B, is the angle of incidence, by others called the angle of inclination.

INCIDE, Angle of, is also used by Dr. Barrow, and some others, for the complement of the above angle, or of the angle of inclination.

Thus, supposing A B an incident ray, and H B a perpendicular, as before; the angle A B D comprehended between it and the reflecting or refracting plane D E, is the angle of incidence; and the angle A B H the angle of inclination.

Others, with Wolthus, make another distinction; which see under the articles Angle, Reflection, and Refraction.

It is demonstrated by optical writers, 1°. That the angle of incidence A B H is always equal to the angle of reflection H B C, or the angle A B D to the angle C D E, and they lie in the same plane. See Reflection.

2°. That the lines of the angles of incidence and refraction are to each other accurately, or very nearly in a given ratio. See Refraction.

3°. That from air to glass the sine of the angle of incidence is to the sine of the refracted angle as 900 to 193, or nearly as 14 to 9; on the contrary, that from glass to air, the sine of the angle of incidence, is to the sine of the refracted angle as 193 to 30° or as 9 to 14. See Refraction.

It is true, fir Isaac Newton having shown, that the rays of light are not all equally refrangible, there can be no precise ratio fixed between the lines of the angles of refraction and incidence: but the proportion which comes nearest is that above specified. See Light, Colour, Refrangibility, &c.

INCIDE of Eclipse. See Eclipse and Immersion.

INCIDE, Axis of. See Axis of incidence. Such is the line B H, fig. 3.
INCISORES, the four front teeth of each jaw; so named because they possess sharp cutting edges. By Linnaeus they are called dentes primores. See the description of the teeth in the article Cranium.

INCISORIUM, from incis, to cut, the table for operations and dissections, used by surgeons and anatomists.

INCISORIUS, in Anatomy. See Incisivus.

INCLAVE, in Heraldry, a term used by Morgan to express an irregular line in heraldry, differing from the indented, inheit, and all the others. It is called by some pates, and by others the dove-tail line, from its resemblance to that joint, known among our joiners by this name. It is also called by some the labelled line. It has these names from the figure of the points, as they proceed from the ordinary, such as a chief or fess resembling the ends of labels.

INCLINATION, in Medicine and Chemistry, the operation of pouring off a clear liquor from some faces, or sediments, by only gently flopping the vessel.

This amounts to the same with what is otherwise called decantation.

INCLINATION, in Physics, expresses the mutual approach or tendency of two bodies, lines, or planes, towards one another; so that their directions make at the point of contact an angle of a greater or lesser magnitude.

INCLINATION of a right line to a plane, is the acute angle which a right line makes with another right line drawn in the plane through the point where the inclined line intersects it, and through the point where it is also cut by a perpendicular drawn from any point of the inclined line.

INCLINATION of Meridians, in Dialling, the angle that the hour-line, on the globe, which is perpendicular to the dial plane, makes with the meridian.

INCLINATION of an incident ray, otherwise called the angle of inclination. See Angle of Incidence.

INCLINATION of a reflected ray, is the angle which a ray after refraction makes with the axis of inclination.

Thus, if A B (Plate I. Opt. fig. 3.) be the incident ray, H B a perpendicular to D E in the point R, and B C the reflected ray, C B H will be the inclination of the reflected ray, and A B II the inclination of the incident ray.

INCLINATION of the axis of the Earth, is the angle which it makes with the plane of the ecliptic; or the angle between the planes of the equator and ecliptic.

INCLINATION of the magnetic needle. See Dipping-needle.

INCLINATION of a planet, is an arc or angle comprehended between the ecliptic, and the plane of a planet in its orbit. See each planet.

INCLINATION of a plane, in Dialling, is the arc of a vertical circle, perpendicular both to the plane and the horizon, and intercepted between them.

To find this, take a quadrant, and apply its side to the side of a square, and apply the other side of your square to your plane: if the plummet fall parallel to the side of the square, then the lower side of the square stands level; by which draw an horizontal line, wherein erect a perpendicular, and apply your square to that perpendicular; and if the plummet falls parallel to the side of the square, then that is also a level line, and your planes stands horizontally; if the plummet fall not parallel to the side of the square, then turn your square, until it does; and draw an horizontal line, on which erect a perpendicular, to which apply your square, and observe what angle your plummet makes on the quadrant, with the side of the square: that is the angle of the inclination of the plane. See Declination.

INCLINATION of two planes, is the acute angle made by two lines drawn one in each plane, through a common point of section, and perpendicular to the same common section.

Thus, in Plate VIII. Geometry, fig. 101, the inclination of the plane K E G L to the plane A C D B, is the angle H F I, made by the right lines H F and F I in the point F, perpendicular to the line of section E G.

INCLINATION, Angle of, in Optics, is the same with what is otherwise called the angle of incidence.

INCLINATION, Argument of. See Argument.

INCLINATION, in a moral sense. See Appetite.

INCLINATION, in Mining, is used sometimes to express the fall or declivity of a stratum which deviates from the horizontal, or a mineral vein, windlace, or fault, which deviate from the vertical, and such strata or slippers are said to dip, deep.
deep, pick, decline, tilt, have a declivity, or to hade, want, batter-off, underbeat, &c. in different districts or situations. See Dip and Hade.

INCLINED PLANES, in Mechanics. See Inclined Plane. See also Mechanics, and Mechanical powers.

Inclined Planes, in Engineering, are strong frames of wood or maffles of earth and masonry, formed into an inclined plane at top, on which a single or double rail or tram-way is laid for drawing up and letting down boats or wagons from one water level of a canal to another, or from one part of a rail-way to another, where a deficiency of water prevents the use of locks, or the descent is too rapid for a rail-way to descend; formerly, inclined planes for boats were called rolling bridges. In our article Canal we have given the principles of letting out and constructing inclined planes, and inclined all the most considerable works of this kind in Great Britain.

Inclined Plane, in Rural Economy, a term applied to that fort of plane which forms an oblique angle with the horizon. In the construction of carriage-ways for the conveyance of different kinds of heavy loads up steep elevations and other rising grounds, this mode has lately been had recourse to with much advantage, in enabling great weights to be drawn on them with much less power of draught; and other kinds of extensive works, roads formed on this principle are frequently found highly beneficial. It has been lately observed, that though this fort of convenience may have hitherto been principally confined to coal works, mines, and other undertakings of the same nature, the period is now at hand "when carriages, moving on level surfaces, or on gently inclining planes, with little friction, and without obstruction, are fast spreading over the face of the country." Besides those which have been noticed, there are many other uses and situations in which they may be employed with the utmost utility and advantage. See Railways.

Inclined Towers. See Towers.

INCLINERS, in Dialing. See Dial, and Decliners.

INCLOSED Land, in Agriculture, the act, operation, or process of taking in and dividing grounds by means of fences. The advantages that necessarily result from the inclosure of land, whether in a state of waste, common, or otherwise, are extremely numerous, and of the most material consequence to the community. It has been observed, that "in addition to those of ascertaining and securing the property, it holds out not only the most ready and certain means of improvement in the cultivation of the former, but in such as have been long under the plough, or any other system of management; being equally useful in its tendency to bring them into the most perfect and advantageous states of culture. Without inclosing, it is conceived, however, much attention may have been paid, or expense incurred, in carrying on the various proceedees that are requisite in preparing land for the reception and growth of good crops; whether of the grain, root, or grass kinds, it is obvious that they can neither be conducted under the most beneficial management, nor yield the full advantage they are capable of, while they continue in a free and open state. Where the land is in a state of arable cultivation without inclosure, the crops, of whatever sort they may be, must constantly be exposed to depredations of various kinds; and if in the state of grasses or palture, injuries of the most prejudicial nature must frequently be unavoidably sustained. And the great advantage and importance of inclosing land are fill more fully demonstrated in the differences which may be observed in respect to the quantity and value of the produce, in such as have been thus divided, over that which is cultivated in the state of open or common field." It has been stated by Mr. Donaldson, that "in proportion as a field or a country is bleak, naked, and exposed to chilling blasts and winter storms, in the same proportion will it be unproductive, compared with lands more favourably situated. Inclosing is a mean of obtaining, by art, a certain degree of that genial warmth so essential to the production of valuable crops, but which nature is not always pleased to bestow. Every day's experience proves that where grounds are sheltered from the violence of storms, as by garden walls, or by plantations of forest trees, they are more productive, and vegetation is earlier than in others similar in every respect, unless in regard to exposure. How many instances occur to establish this fact in respect to large fields, as well as to gardens, orchards, &c. Let the observer, or farmer, who pollishes an inclosed farm, examine that part of a field where, owing to the decay of fence, the wind enjoys a free passage, and he will be satisfied of the benefit of inclosing, from the superiority of the crop in the other part of the field over that which is within the influence of this additional exposure. While, on the other hand, the possessor of an open field farm, by examining the superior verdure that takes place in any part of an arable field, that may be enclosed, will observe that the field sheltered in a remarkable degree, may satisfy himself, that were the whole equally sheltered, the produce would be more abundant." In the Mid-Lothian Report it is likewise stated, that "as the warmest air lies nearest the surface of the earth, being that portion of the atmosphere, which, like a blanket, nature spreads over the soil and its productions, fences of all kinds tend more or less to prevent such a valuable covering from being blown off by the winds." Indeed, by judicious fencing in, or inclosing of land, there can be no doubt but that warmth and shelter is afforded to cattle of various kinds. Under these circumstances, animals are invariably found not only to advance in flesh much more rapidly, but to be freer from disorders, than when kept in situations or exposures that are bleak, and which cannot afford warmth or shelter to them. If any person entertain doubts respecting the inclosed pastures being better adapted for rearing and fattening live flock than open fields, he may easily satisfy himself by comparing the live flock in an inclosed parish with that of one in the open field state." It is supposed there must be much mistake "if he will not find them in the latter, not only fewer in number, but each animal, on an average, thirty or forty per cent. inferior in value." In fact, inclosing, it is conceived, "may be denominated the first step towards effecting improvements in the breeds of the different species of live flock. And on the whole, this "is reasoning on plain established facts, and on such as afford the most indubitable evidence of the inferiority of inclosed fields, whether for tillage or pature. Were farther proof necessary, the additional rent that is everywhere paid for inclosed land, beyond that paid for land of an equal quality in the open field state, is sufficient to place the matter beyond all possibility of doubt." Beside, the value of the land in most situations is considerably improved by the practice of inclosing. The proportion of increase that may be produced in this way, whether the lands inclosed be in a state of leaf, or in the occupation of the proprietor, muft, however, necessarily depend greatly on the nature of the soil, and the system of management that is afterwards pursued.

In a work on modern agriculture it is remarked, that "lands of a middling quality, good turnip foil for instance, are probably benefited to a greater degree by inclosing, than those of superior or inferior quality. Lands of this description, in the open field state, may, it is contended, be considered
considered as rented to the full at fifteen shillings per acre; whereas there are few instances where such lands, when inclosed, are rented under twenty shillings; an advance so great as to afford the proprietor a handsome profit after paying the interest of the money expended. Thus does inclosing not only increase the quantity and quality of the produce, so as to enable the farmer to pay his landlord a higher rent, and to contribute a larger share to the revenues of the state, but from so many people being constantly employed in making and repairing the fences, inclosing, in this view, must also be considered as beneficial.

It must, however, be allowed, that there are in many districts of this kingdom extensive, barren, and mountainous tracts of ground that are not capable of ever being inclosed with the least chance of advantage; or which, if they could be inclosed, could never derive any augmentation or improvement from it: the only methods in which they can be bettered, is by being rendered in some situations more free from injurious surface moisture, by judicious drainage, or the introduction of better breeds of the several kinds of domestic animals which may be turned upon them. Some of the large sheep farms in different parts of Scotland, as in the shire of Peebles and the Highlands, are much in this state, and no other form of inclosing being necessary than merely a "ring fence," or boundary round the different farms. And where any kind of inclosures become requisite within such fences, they are simply such as permit the culture of a small number of acres for the use of the farmers, or in the view of forming plantations for protection and shade, etc.

In other situations where the lands are capable of being cultivated almost constantly under the grain fyllem, inclosing, at least with any kind of high fences, may, in a great measure, if not wholly, be unnecessary. But, in common, where lands are proper for being cultivated under a fyllem of husbandry, such as that of alternating grasses or other kinds of green crops, with those of grain or root crops, and in that way having the means of combining improvement in the breed of live stock with that of the cultivation of grain, the practice of inclosing must always be necessary and advantageous in a high degree.

Yet, however advantageous in these different points of view the benefits resulting from the inclosing of lands may be, the practice is far from being so much promoted and attended to as its importance seems to deserve. And it is probable that this may in some measure have proceeded from the great difficulty that necessarily attends the business in almost every instance, and particularly where waste or common field lands are to be inclosed, on account of the great diversity of claims upon them, as well as sometimes from the improper management of the persons who have the direction of the business. Where inclosures of this sort are to be made, the circumstances that are chiefly to be regarded are those of the rights of the different classes of claimants, without any distinctions, the ascertaining fully the nature and extent of the land to be inclosed, the provision of proper cottages for the poor in the acts of inclosure, and the appointment of commissioners duly qualified for the execution of the business.

It has been remarked by Mr. Somerville, in a paper on the different modes of forming inclosures, in the second volume of "Communications to the Board of Agriculture," that inclosing has long been considered, and very justly, not only as a certain means of improving waste and uncultivated lands, but also as an essential requisite to the completion of improvements upon the belt soils, and such as have been long under tillage. For whatever care or expense may have been employed in clearing, draining, tilling, manuring, weeding, etc., the whole of the benefits resulting from these can never be completely united, while the soil remains in an open uninclosed state. When the fields are in grass they cannot be faroed to advantage without fences, and when they are in tillage, the crops, of whatever kind they may be, are exposed to every injury that can be suffered from the encroachments of sheep, cattle, or other animals. In many of the counties throughout the kingdom, the features of this improvement are strongly marked, and the ideas of shelter, ornament, and increased produce, are visible to even the most superficial observer, and afford a very just comparative estimate of the advantages to be derived from inclosing, by contrasting the value of lands that are inclosed with others of the same quality that still remain in an open field state; the faving in point of labour, the perfect security to the crop while the lands are under tillage, together with the warmth and shelter afforded to the flock and herbage when the fields are in pasture, form a striking contrast when compared with the open, unsheltered, unprotected, and unproductive state of uninclosed fields. Obvious as these advantages are, it is to be regretted that the system of inclosing has, in too many instances, met with much opposition; and even in those cases where its benefits are clearly ascertained, much difference of opinion still exists, with regard to the nature of the fences requisite for different situations, the materials or plants that should be used, the belt mode of executing them, and the fence of the year most suitable for doing the work. The objection to often made to inclosures brought into parliament is a very striking proof of the former, and the little judgment that is shown in accommodating the fence to the natural circumstances of the fields to be inclosed is conclusive as to the latter. It too often happens that proprietors and farmers, without due considering either the nature of their soil or its local situation, resolve upon and adopt a mode of inclosing which they have been successful in other places, without once considering that the soil, climate, and other circumstances, which combined to render the plan successful in the situations they wished to copy, are totally wanting in theirs. Owing to this much money is expended and many attempts prove abortive; the system of inclosing falls into discredit, and is considered as impracticable in many cases where good and lasting fences might be reared at the same, perhaps less, expense than such improperly and badly formed. The ill effect of these is greatly influenced by the rigour of the climate, while the true and only cause is, the ignorance or want of discernment in the persons who make these unsuccessful attempts.

Indeed the mistakes committed in this way are innumerable. Sometimes live fences are planted in situations, and upon soils where it is impossible they can grow, far less arrive at perfection; and where substantial stone fences could be made, not only at little expense, but the building of which, by collecting the stones, would rid the adjoining surface of a nuisance, and remove an incumbrance which too often constitutes a material bar to its cultivation. The discernment necessary to discover this is not great; notwithstanding which, we too frequently have occasion to observe large fields inclosed, either with dwarfish, crabbed, thorn, hedge, and rotten decayed palings, or with turf or earthen mounds, obtained by paring off the belt part of the surface soil, while the fields thus wretchedly inclosed by fences, which, on account of the instability and perishable nature, must one day be abandoned, are covered with numerous large stones, the removal of which is an essential requisite to their improvement. The same circumstance often happens where live fences might be reared, which, in every instance where they can be brought to perfection, are to be considered as preferable.
preferable to any other. In place of making the hedge with such plants as are suited to the soil and climate, they are often directly opposite—dwarf, flinted, white thorn hedges being very frequently seen upon cold wet lands, and in bleak exposed situations; upon which, if beech, blackthorns, or crabs, had been planted, they would have grown readily, and made complete fences in a very short time. In other instances the fence fails, or becomes faulty, from circumstances which the planter may be disposed to consider as immaterial. For example, in inclosing a large field, a great part of the outline of which is wet, if white-thorns are planted in the ordinary way upon the common surface, they will never make a good fence; whereas by planting them in the face of the bank of earth thrown out of the ditch, being thus raised above the level of the field, and placed upon a dry bed, they thrive, and soon establish themselves; while upon very dry lands, with open bottoms that possess little capacity for retaining moisture, the hedge very often dies from an opposite cause. When the plants are let upon the mound raised above the common surface, if the seafon is but commonly dry, their growth is considerably impeded from the want of moisture; and in severe winters, from the porous nature of the soil, the frost gets access to the roots, and either kills whole rows or lines of hedges in a few weeks, or so far hurs them as to check their future growth and improvement.

And it is stated, that in perusing the different county reports, all the farmers concur in opinion as to the utility of inclosures; but that it is mentioned by several of them, in terms of regret, that the obstacles thrown in the way of this valuable improvement, by ignorance and obstinacy, are great and manifold. In some cases they speak in terms of the highest panegyric of the utility, cheapness, and durability of certain fences, such as quicks, beeches, crabs, &c. when they are planted upon the foils to which they are respectively the belt adapted; while in others they mention, in pointed terms, the perilous nature and transitory value of many of the fences employed, the annual expense required to keep certain descriptions of them in repair, (the dead hedges and paling,) and the great extent of valuable ground that is occupied by the others, especially the inclosures made by double ditches with a bank between them and a hedge on each side, and of the common hedge and ditch, and hedge and bank, which, at the same time that they occupy a considerable space of ground, are very seldom good fences, in some inclosures covering thrice, and in others four times the space that a fence of a different kind would do, if properly kept. Great contrariety of opinion also prevails in regard to making trees a part of the inclosure, either in hedge-rows or belts of planting. From such diversity and opposition of sentiment, it is difficult to form any fixed or certain opinion upon the subject in question.

The different points to which the proprietor or occupier ought to pay particular attention, before he commences any plan of inclosure, would seem to be

1st. The nature of the soil.

2dly. Its present worth, and the increase of value expected from inclosing it.

3dly. The objects to be attended to in making inclosures; and whether the greatest value of the fences is expected to arise from their simply confusing their flock, or from their affording shelter to both flock and crop, or from the union of shelter and inclosure.

4thly. The modes of inclosure suited to the natural circumstances of the soil, climate, &c.

5thly. The materials for making the fences, and the means of obtaining them. And,

6thly. Expence, which is another important point to be considered, but which must depend upon so many local circumstances, that it is impossible to form any estimates that could be of much service in guiding the improver.

Nature of the Soil.—In respect to this, a careful inquiry seems to be one of those requisites essential to the success of every plan of inclosure; for though there are, comparatively speaking, few situations, however elevated above the level of the ocean, and free from any description of soil, where a good live fence may not be reared, with one sort of plant or another, yet it is an object of the first importance to know the plants best suited to every variety of soil, as, by a judicious choice of these, much loss and difficulty is avoided, and good substantial fences are made in a short time, and in many situations where, from a mistake as to the plants employed, the fence has languished for years, and ultimately perished, notwithstanding every care that could be bestowed upon it. In some inclosures, we have known twenty years experience barely sufficient to deceive those who had made mistakes of this kind. In a few cases, however, where this oblivion has given way to common fence and observation, and where the plants of which the hedge was originally made have been taken up, and others better adapted to the soil substituted in their room, these last have, without much trouble, made a good fence in a very short space of time, and with very little trouble.

It is well known that white-thorns, or quicks, as they are commonly called, are reared with great ease, and, under proper management, soon make useful and handsome fences upon all dry soils, provided the situation is not too high and exposed. In such places, though the plants do not perish entirely, they never attain the strength or vigour necessary to make a good fence. In cases where the natural surface of the ground is rather too moist for white-thorn, the excess of damp may be carried off by a ditch on one side of the plants in the usual way. In marshy situations, where a ditch on one side would be insufficient to lay the soil dry enough for the quicks of white-thorn, it ought to have a drain on each side of the bank on which the thorns grow, and which would be particularly favourable for the growth of ash-poles and various other sorts. But in every case where thorns are planted upon the common surface without a ditch, and upon dry ground that has been previously prepared by dung, lime, &c. they grow better than where ditches are used, because the ditches serve as open drains to carry off the moisture, a circumstance which in dry seasons is often very detrimental to the growth of the hedge. Except in weeding, the thorns should not be touched for the first four or five years of their growth, unless it be to crop the most luxuriant of the lateral shoots: at the end of that time they should be completely trimmed and put into shape, leaving the top shoots untouched, till the hedge attains the necessary height; when this ought also to be cut over, and its further growth upwards prevented by regular yearly cuttings afterwards. See Fence and Hedger.
INCLISING OF LAND.

It grows well upon all soils, but particularly upon deep and moderately dry loams. Its progress is, however, slow, even in the most fortunate situations, which renders it unfit for common use; unless in pleasurable grounds, or places where tallow or fancy requires it. When intermixed with the white-thorn it is, however, more rapid in its growth, and forms a most beautiful kind of fence.

But the use of beech, for the purposes of fences, has not hitherto been very common; they are, however, felt coming into use, and perhaps will soon be the only kind employed in the uplands, or upon the cold wet soils in the lower districts of the kingdom; for in these situations, so far as the experience of several parts of Scotland can ascertain that point, they are, it is said, remarkably adapted. In East Lothian there are several tracts of land, the soil of which is of a very inferior quality, that have had their value greatly increased, by inclining them with beech hedges, upon which thorns were formerly tried without success, and much trouble and expense incurred in the attempt; while the beeches, which originally stood no more than the thorn, without any trouble, very soon become good fences. Along with their growing fo readily in these unfavorable situations, they polishes a property well suited to a cold or exposed country; namely, that of preferring their leaves through the winter, and indeed till an advanced period in the spring; by which they afford shelter to the grazing stock, and also to the pasture in the early part of the season; when it is apt to be hurt by the cold, nipping, frosty winds. The birch is likewise peculiarly adapted to cold clays, where it seldom fails to thrive, and form a good fence; some caution, however, is necessary as to the management of it. It is also said to be the only plant which succeeds in the sandy rabbit-warren land, such as is found in some parts of Suffolk. In all cases where it is intended to cut or plough it, the operation should be done about the end of autumn, as the juices are at that time retreating to the root, and long before the circulation is again renewed the wounds are healed; whereas, when the cutting is deferred till the spring, or beginning of summer, when the circulation is going on, the juices flow out by the wound, and continue to run off in that way during the whole of summer; by which means the plants are so weakened and exhausted, that many of them die, a misfortune which is entirely prevented by cutting about the end of autumn, or during the winter season.

Upon all wet or marshy grounds, willows, alders, and poplars thrive, and are extremely useful in connecting in many situations, where other plants would either perish entirely, or remain in a dwarf stunted state. In Huntingdonshire, and several of the fenny parts of England, these plants, in conjunction with the thorn, form almost the only description of live fences that are met with; their value in those parts is well known; and in every similar situation throughout the kingdom, if proper trials were made, they would be found equally useful. Hedges made with willows have an advantage over almost every other, as, after the hedge has arrived at a certain height, and is properly laid down and bound together, the young shoots may be annually taken off, and sold to basket-makers for a considerable sum of money. They have another obvious advantage, namely, the ease with which they are propagated, being raised by simple cuttings, without any other trouble than that of merely flicking them into the earth. Where this is practiced, and in most situations it may be done with great ease, the farmer or proprietor will not only have his fields inclosed, but the fence will be converted into a source of revenue, by the sale of the young shoots yearly. Where the Huntingdon willow is used, a farther emolument may arise to the proprietor, by allowing a certain proportion of the plants to run up into trees; with very little care they soon arrive at a great size, and are of considerable value; the wood is soft, easily wrought into any form, takes a fine polish, and can be stained of any colour. The use of willows, poplars, &c. is not confined solely to wet or marshy grounds, they thrive upon almost every soil, and, indeed, make more progress upon such as are moderately dry than upon very wet lands; upon the latter, however, they grow better than any other plant, and on that account deserve a preference in many cafes.

And the hazel, elder, &c. are plants which grow well upon all dry soils, and, if properly managed, by laying wattling, &c. produce wood enough to form a very sufficient fence; but their want of prickles render them less eligible than thorns. The elder possesses a property which, along with the beauty of its flowers, will give it a preference to most other plants in many situations; namely, that of its being propagated from cuttings, with as much ease as the common willow. Where the hazel is used for inclosing with, and the proprietor is disposed to take the necessary trouble, it may be rendered very useful, by cutting the hedge within four feet of the surface every second or third year, and felling what is cut off to coopers or basket-makers: hazels are well known to make the best and most durable hoops, and generally bring a high price for that purpose in most situations.

Though the larch has not hitherto been much used as a hedge plant; yet, from its growing so readily, and bearing the operation of clipping so well, it seems very much adapted for that purpose. In exposed situations, where thorns would fail, the larch would be found an excellent substitute, and many fields may be inclosed with it that would otherwise remain open. Where it is intended to inclose a field with larches, the plants made use of should be at least seven years old, and the strongest that can be obtained of that age. They should be taken up in the most careful manner, preserving the whole of the roots, and planted in a trench where a considerable quantity of dung or compost has been put. The most proper season for this operation is about the end of November, or in the early part of January; at either of which periods, if they are carefully lifted, and replanted without any destruction of the roots, they will suffer no check whatever, and grow readily and vigorously in the spring. It is worthy of notice that the tops ought never to be allowed to exceed the height of six feet; because, after they pass that height, the wind has so great an effect upon them as to destroy any binding that may be made with their lower branches; cutting the tops has also another beneficial effect, namely, that of making them pull out more vigorously below. Larches have, however, one defect, in common with hazels and some other plants, namely, the want of prickles, which certainly impairs the value of any fence made with them; as neither sheep nor cattle are disposed to respect any hedge so much as those that are made with plants of the prickly kind.

The whin, or furze, is also a plant that is known to grow spontaneously, and attain a great size upon soils and in climates where scarcely any other would live. In all cafes where whins are found growing naturally, and of any considerable size, hedges of them may with safety be attempted: but as the whin seldom grows to any considerable height, hedges are not often made with it. This material, however, forms a good fence when a sufficient number of plants can be reared and brought to perfection; and, from its numerous prickles, very effectually prevents both horses, sheep, and cattle, from attempting to break through it. It has, how-

Vol. XVIII. 5 C
ever, one defect, and that is considerable; being raised a good deal above the common surface, the plants are exposed to many accidents, arising from drought, frost, &c.; accordingly it often happens in severe winters, that whole lines of hedges are killed at once, and of course much labour and expense thrown away.

There are, besides these, several other kinds of plants, such as the bramble, mulberry, &c.; and various sorts of fruit trees and shrubs, such as the gooseberry, &c. that may be occasionally employed in the same intention with advantage, though they have not yet been much had recourse to in such a view.

\textbf{Present Value of the Soil, and the Improvement of it by Inclosure.}—It may be remarked that in every plan of improvement, whether by inclosing or otherwise, it is very material to ascertain the present worth of the land, and the probable increase of value that may be expected from the undertaking; for unless this point is judiciously weighed, the operations will proceed at random, and much labour and expense may be incurred without any adequate advantage resulting therefrom. For much and justly as the advantages of inclosing are extolled, and they are unquestionably great; there are certain circumstances of soil and local situation that bid complete defiance to this and every other attempt at improvement. For example, in high rocky situations, where the soil is not only thin, but of a bad quality, where the lands can never be objected to the plough, and where the herbage is not likely to be muchameliorated by shelter, little benefit will be derived from inclosing. The only advantage resulting from the practice in such cases seems to arise from the saving of a shepherd’s wages, which, when the flock are pastured in an inclosed field, is rendered unnecessary; but which, if accompanied with no other advantage, will be found a paltry equivalent for the expense of inclosing the soil. On the contrary, however high or exposed the situation may be, if the soil is of a good quality, and a species of plants can be met with of a nature so hardy as to bear the climate, the value of the property will be so far improved by the shelter arising from the fence, as amply to compensate the expense incurred in making it. In many of the backett and moor exposed situations in Britain, the soil, though slightly elevated above the level of the ocean, is equal in quality to what is met with even in the most favoured situations, and for the most part requires nothing but shelter and judicious culture to render it highly valuable. In detailing the different kind of fences, especially that known by the name of hedge and belt of planting, an opportunity was taken of pointing out several instances, where the mode of inclosing has benefited the property so inclosed, in a tenfold proportion, in a very few years. Upon this point it remains only to hint, that every person, whether proprietor or tenant, should, before he commences his operations, pay very particular attention to the present value of property in an uninclosed state, and the extent to which it may be improved by inclosing; as without such previous knowledge, in place of being repaid by the pleasure arising from reposing the property ornamented and improved in proportion to the trouble and outlay of money, large sums will often, it is suspected, be expended, without adding to the general appearance of the country, or materially contributing to augment the value of the soil and property.

\textbf{Objects to be regarded in forming Inclosures.}—It may here be noticed, that, in some situations, all that is required is merely the confinement of the flock, in others, shelter to the flock and herbage are the principal objects; but in a great majority of cases, the union of both is necessary to complete the system of inclosing. In wild low situations perhaps a stone wall, or a low thorn fence, will answer every purpose required, and produce every benefit that could be expected from the inclosure; yet these fences would be found totally incompetent to the purposes of inclosure in the hilly and upland parts of the country; for, though confining the flock might be completely answered by either, the important requisites of shelter would be entirely wanting. Other matters of equal importance ought to enter into the consideration of persons inclosing. The separation of the fields inclosed, so as to render that of each field as nearly as possible of an uniform quality, the separation of flock as may be thought most advisable, together with the securing a sufficient supply of good water, are requisites so essential to the success of the undertaking as to entitle them to a high degree of attention. Mr. Donaldson, in speaking of inclosures, says, that the old fences were planned with a view chiefly to inclose fields as similar as possible within each division; beauty or regularity does not. He thinks, seem to have attracted much of the proprietor’s or farmer’s attention: utility, it would appear, they kept principally in view. Our modern improvers, on the other hand, in too many instances at least, have an evident disposition to sacrifice utility to tale and regularity in appearance. Hence, it is not uncommon, in a new inclosed parish in England, or even in an estate in Scotland, where the proprietor has the sole power of management, to see several different sorts of fences in the same inclosure, which, with proper attention, and a little sacrifice of taste, might have been included in the adjoining fields with much greater propriety. Thus, in place of forming the fences in such directions as that the greatest advantage might have been derived, by not only inclosing and subdividing the estate, but also by separating, in every possible case, fields of different and opposite qualities, it not unfrequently happens, that the fields of Norfolk and the clays of Lincolnshire are, as it were, inclosed within the same fence; than which it is impossible to figure any management more improper. If a regular rotation of cropping be adopted on a farm where each inclosure contains a variety of soils, it will of course be limited to that fort which most prevails. When the most prevalent soil is of a light and sandy nature, the portions of better soil contained in each inclosure must be cultivated under a system, in regard to cropping, not calculated to produce the greatest returns. On the other hand, when the predominant soil is deep and fertile, that of a lighter nature must be exhausted, were a mode of cropping purposed calculated only for the soil of inferior quality. Whereas, had a judicious arrangement been made in regard to the form of the inclosures, the good and bad soils might, in many cases, have been kept separate, and, as often happens, two rotations of cropping adopted on the same farm with equal propriety. Perhaps also fences in straight lines, in place of curves, might be disputed on the score of taste; but that is a question foreign to the object of the present investigation, which has utility only for its object.

The new inclosures differ as much from the old in regard to size as in form. The old inclosures generally contain from three or four to fix or eight acres; few of such as can be properly denominated old exceed ten; while those that have been formed in latter times extend from ten to twenty, sometimes to forty or fifty. This difference in the size of inclosures is greatly, if not entirely, owing to the change of opinion in regard to what was and what now is considered by individuals as the proper size of farms. In the same, or nearly the same proportion as farms were enlarged, so were the dimensions of the new inclosures. The more ancient inclosures, such as those in several parts of Essex, Kent, Suffolk, &c. are evidently too small, while those in many other districts
INCLOSING OF LAND.

districts are too large. There is a medium in regard to the
size of inclosures, as well as in other things; and to discover
and adhere to it, as nearly as circumstances will allow, is
certainly for the interest of the proprietors, the tenants,
and the public. Where the inclosures do not exceed three or
four acres, the quantity of land taken up in erecting the
fences is a heavy rentcharge, viewing the inclosure as a
part of the farm, of the estate, or of the national territory.
A free circulation of air is also prevented, especially if there
be hedge-row trees, to such a degree, that it may be difficult
to say whether the crops are more benefited or injured by
the fences when so closely placed. As one of the most
important advantages that can be derived from inclosing is
shelter, large inclosures must, on the other hand, be equally
improper. When a tract of thirty or forty acres is included
within one fence, it would be absurd to suppose that the
fence can afford the same shelter as if these thirty or forty
acres had been subdivided into three or four fields. When
the inclosures are made so large, the advantage of fencing,
so far as regards shelter, must be merely a secondary object
with the person who erects the fence.

Having pointed out the lads and inconvenience arising
from too small and too large inclosures, it may be necessary
to suggest what, upon the whole, ought to be considered the
best size. This it is proposed to do on the authority of Mr.
Bakewell, from whom the British farmer might have learned
many useful lessons on subjects connected with husbandry.
Besides what related more especially to the improvement of
the different species of live stock, it was the opinion of that
expert farmer, that fifty acres of pasture, divided into five
inclosures, would go as far in grazing cattle as sixty acres in
one field. If there was a man in the island that exceeded
another in knowledge as a breeder and grazier, it was Mr.
Bakewell; his opinion, therefore, founded on the experience
of many years, may be considered as conclusive in regard
to the proper size of inclosures, in so far as the breeder
or grazier is concerned; and from what is above stated, it
appears that from eight to twelve-acre fields are best calculated
for either of these purposes. Mr. Marshall also, in
corroboration of this, hints in his "Rural Economy of
Gloucestershire," that the most experienced dairy farmers in
that district consider what he calls a suit or pastures as a more
profitable mode of pasturing cows than one large inclosure.
As no farm can be kept constantly in tillage with ad-
vantage, and as the best mode of cropping that can be
adopted for the generality of soils is, in his apprehension,
that by which nearly the one-half of the farm is in tillage,
and the other in pasture, it is necessary, in determining the
proper size of inclosures, to have regard to the two great
branches of husbandry, namely, grain and grasses. In regard
to the latter, so far as the practice of the two counties most
remarkable for grazing and dairying can go, the matter
seems determined; and in respect to corn husbandry, as
middle-sized inclosures enjoy the advantage of shelter to a
greater degree than those of larger size, and a more free
circulation of air than those of small dimensions, there can
be no reason to hesitate in determining, that the size of in-
closures best suited for the breeder, the grazier, and the
dairymen's purposes, will also best answer those of the cul-
tivator of grain.

Modes of inclosing suited to the natural Circumstances of the
Soil, &c.—It is stated by Mr. Somerville, in the work al-
ready mentioned, that this matter has been in some degree
discussed in the preceding article of inclosure. There can-
not, however, remain a doubt that the success of every at-
tempt that is made in the way of inclosing must in a great
measure depend upon the discretion of the person who
undertakes it. A material consideration in such cases is, to
determine whether live or dead fences are the most eligible
or best suited to the natural circumstances of the soil. The
former comprehends every fence made with growing plants;
the latter includes not only the different kinds of wall or
dike made with dry stone, stone and lime, stone and clay,
turf, &c. but also the different kinds of dead hedges and
paling. Into this estimate ought also to enter the com-
parative usefulness and durability of each, together with the
first cost. In general, the first clafs, namely, live fences,
where the plants are properly chosen, and well adapted to
the soil, are uniform in this respect, that, under proper
management, their value is yearly increasing; while that or
even the built-constructed dead fences is annually growing
less. Where they consist of dead hedges or palings, their
decay is certain, and commonly rapid; and even when they
are constructed with stone and lime, which are by far the
most durable of that clafs; though they make perfect
fences at once, and the proprietor or occupier enters into
immediate possession of every advantage that can arise from
them, yet from the hour they are built their decay com-
ences, and, after the first few years, a regular and progres-
sive expence is incurred to keep them in repair in a proper
manner.

It is affected, that in all upland situations, the first clafs
of fences will be found the best; of that class, however, the
beech hedge, and hedge with a flip of planting, deserve a
preference, as they unite in the highest degree the important
qualities of shelter, ornament, and inclosure. The beech,
under proper management, attains a great size even upon the
poorefl soils, and soon forms a useful fence in situations
where thorns and other kinds of hedge plants would either
perish or remain in a dwarfish state; with this additional
material advantage, that, by keeping its leaves during the
winter, it affords shelter to the flock and pasture at the most
inconvenient season, and when it is most wanted. The inclosing
fences in these situations should likewise be high in order to
produce the greatest effect and utility. But that in low
situations, where little is to be apprehended from the want
of shelter, thorn hedges kept low, or any of the different
kinds of stone walls, will answer every purpose. And since
the soil in these low situations is for the most part of very
great value, those fences, from the little space they occupy,
will be found preferable to every other kind.

Materials for forming the Fences, and the Means of pro-
viding them.—In speaking of the nature of the materials for
making fences, in the above observations upon the modes of
inclosing suited to the natural circumstances of the soil, it
has been pointed out what appeared the best, upon the sup-
pposition that the materials could be readily obtained at a
reasonable price. In many situations, however, the scarcity
and apparent want of many of these materials form an al-
most insuperable obstacle to inclosing upon the plan above
hitherto. For instance, in the remote parts of the king-
dom, where the different kinds of trees and hedge plants are
either very scarce, or not attainable at an enormous price,
it will often be found necessary, in the inclosing of upland
districts, to surround the fields with stone walls in place of
hedge, or hedge and flip of planting; and in a few situa-
tions in the low lands, where stone walls would be the most
eligible fence, from the scarcity of that article, hedges, or
hedge and ditch, are had recourse to. Under such circum-
stances necessity is the law; and the person inclosing must
accommodate his plans to his resources. It will, however,
frequently happen, that the materials wanted will be met
with upon the spot, not only without expense, but with
much advantage to the property; as in cafes where the
fields
fields are infested with limes, their removal will at once facilitate the improvement of the field, and furnish good materials for inclosing it. But even where the resources are less visible, and there are no limes upon the surface, by a careful examination of the sub-stratum plenty may often be met with; or, in defect of these, clay for making either bricks or mud-walls may be had merely for the trouble of digging or getting it up.

In forming other kinds of dead fences for inclosing lands, such as palings, hedges, &c. materials for constructing them may be procured in almost any situation, from the thinnings of young plantations, from coppices, and the cutting down of old hedges; even the deficiency of hedge plants and young trees might be, in a great measure, if not entirely, got the better of, if every proprietor were to have a small nursery for raising them for his own use, and that of his tenants. To the convenience and saving of expense with which this practice would be attended, we have to notice an unspoken advantage, namely, that arising from the use of plants propagated in, and inured to, the climate where they are afterwards to grow. It must require little knowledge of the subject to convince any one, that plants, of whatever kind, reared in the upland and hilly parts of the kingdom, will thrive better than such as have been reared in the warmest and most sheltered spots. To what, it is asked, are we to ascribe the amazing fine and luxuriant growth of many trees in the islands of Scotland, or even in Norway or North America, but to the circumstance of their having come into existence in the climate and situation where they were afterwards destined to grow; and by being thus early inured to the climate, became, to all intents and purposes, indigenous plants.

It may in addition be remarked, in regard to adapting the plants to the soil, that it is not the least important consideration with persons inclosing, after having determined whether live or dead fences should be used, to make choice of the plants best suited to the soil. In the flat low parts of the country, where the soil is loamy or gravelly, and at the same time moderately dry, and not greatly exposed to any prevailing winds, white-thorns will be found both the cheapest and the best. Hazel, elder, and a multitude of others, might be used for that purpose in these situations; but they are liable to objections to which the thorn is not. If in these low situations it is meant to plant trees along with the fence, either in hedge rows or belts, the dry soils should, it is observed, be planted with oak, ash, elm, plane-tree, chestnut, beech, &c. and the moist parts with poplars, and the different kinds of willows; by such means the whole will thrive, and in a short time become valuable to the proprietor. In the upland and hilly parts of the country, unless the soil is wet indeed, the hedge plants should confine either entirely of beeches, or a mixture of beech and larch; the last is known, as has been seen above, to answer well in these exposed situations, and not only endures planting and clipping without injury, but thrives remarkably under these operations; where the soil, however, is wet or spongy, a different description of plants should be used; willows of different kinds, poplars, birch, or alder, will then be found the best, and ought, in preference to every other, to be made use of. By thus adapting the plants to the soil and climate, few plans of inclosure will prove abortive in any situations so far as the fencing it is concerned.

Expense of performing the Work.—It is obvious that this must be extremely various according to the nature of the situation and other circumstances; but it will seldom be very great where due care is taken in the direction and execution of the business, and the necessary materials are capable of being had near at hand, and in sufficient abundance.

From the perusal of the different surveys now in possession of the Board of Agriculture, it would appear, that in almost every county throughout the kingdom, considerable tracts of the soil are inclosed, and that many plans of additional inclosures, to a very considerable extent, are now in contemplation. The surveysors appointed by the Board are unanimous in their approbation of the system, which they represent as so beneficial in its consequences, that in many cases the value of the property has been thereby increased in a fourfold proportion, and, in some well-authenticated instances, considerably more. The inclosing fences at present in use are of great variety; and a part of them, particularly such as have been made of late years, executed in a handsome substantial manner, uniting at once the important points of shelter, inclosure, and ornament. The appearance of these, owing to the judicious manner in which they are managed, convey to the mind the strongest ideas of permanent and valuable improvement. The different kinds of stone-walls, by having a broad foundation sunk deep enough in the earth to secure the masses, and tapering gradually upwards, and finished at top with a proper coping, are found to last many years, with but very slight repairs. The hedges, from the circumstance of their being planted at a proper season, the plants made use of adapted to the nature of the soil, and afterwards kept in order by regular weeding and trimming, are of immense value, and form the most beautiful and lasting fences that can be imagined. Many other descriptions of fences are equally perfect and valuable; but though these circumstances are mentioned with much satisfaction, and must give pleasure to every person who feels, or has the smallest interest in the improvement or welfare of his country, it is with pain remarked, that in too many instances the system of inclosing is extremely defective; and much loss of fertility has been known to secure and unite the whole of the benefit to be derived from it, than the importance of the subject deserves. To confine the flock往年, in too many instances, to have been the sole object; while the weightier matters of shelter, both for the flock and pasture, separation of soils, separation of flocks, and many other points of equal importance, have been entirely overlooked. In too many instances, no attention has been paid to the natural circumstances of the soil intended to be inclosed. High inaccessible walls, belts or strips of planting, and hedge rows of trees, being very often met with in the lowest and warmest situations, where little or no shelter is necessary; while in the hills and uplands, and along the sea-coast, where shelter is indispensable, both for the flock and pasture, and where its advantages are incalculable, the fence very often consists of a naked stone wall, which, though it may, and indeed does answer the purpose of confining the flock, polishes no other advantage; and many tracts of immense extent, the value of which might be improved in a tenfold proportion by hedges and belts of planting, exhibit a naked bleak appearance, and continue exposed to every blast. The loss and disadvantage attending this injudicious mode of inclosing are strikingly obvious. In the low warm parts of the country, where the land is of immense value, much of it is occupied by fences which the nature of the situation does not require, while in the more elevated and exposed parts, where shelter is the sine qua non of improvement, and where the land occupied by the fence is, comparatively speaking, of small value, the fence, in place of affording the necessary shelter both to the flock and pasture, is barely adequate to the purpose of inclosing the field. Under such circumstances, the pasture will for the most part be scanty;
ICLosing of Land.

And neither a breeding nor a feeding flock will make half the progress upon it that they usually do in cafes where they enjoy the benefit of complete timber. A defect equally injurious to the proprietor or occupier, and highly inimical to permanent improvement, seems also to prevail in the choice of the materials of which inclosing fences are made. In every instance where circumstances will admit of it, present use ought, if possible, to be united with durability in the formation of every fence; an attention to this is, however, too often totally wanting, both with proprietors and farmers. Provided the present purpose is answered, future conseqeques are disregarded; and neither a knowledge of the perishable nature of the materials made use of, which daily experience presents to their view, nor the frequent and heavy expences to which they are put for repairs, have been sufficient to make them alter their system. Amongst these perishable fences are to be ranked the different kinds of earthen and mud walls, of turf, of turf and stone, together with the whole of the wooden fences, comprehending the different kinds of paling, dead hedges, &c. It is added, also, that the ancient custom of inclosing fields with high earthen banks or mounds, sometimes with and sometimes without a paling on the top, which prevailed formerly in many parts of England, and which is now pursued in the north of Scotland, though it did very well as a rude eay in the way of improvement, when other modes of inclosing were either unknown or imperfectly understood, and might for a time answer the purpose, either of confining the grazing flock while the field was in pasture, or protecting the corn crops when it was under tillage, is perhaps the worst and most perishable of all inclosing fences. After being reared with much labour, and committing a theft upon the adjoining surface, which is paid off to a considerable distance on each side, it remains but a very few months, or even weeks, in a perfect flat; indeed, from the moment it is made begins to decay: and the operation of the weather upon it, for a few years, renders it useless as a fence. Accordingly in many parts of the island the remnants of such fences are met with, which, though they were originally of considerable height, and to appearance strong and formidable, are now so completely beat down and levelled by the action of the weather, as to render it in some cases a matter of difficulty for the curious to trace their foundations, or the direction in which they formerly ran. The case is the same with walls formed entirely of turf, or a mixture of turf and stone. Thence, though made at considerable expence, and, as has been already noticed, by robbing the neighbouring surface, are equally perishable as the simple earthen mound. Upon whole farms, and even estates, that were formerly inclosed with turf, or stone and turf walls, nothing now remains but their velliges, which, while they exhibit a striking proof of their perishable nature, afford at the same time a satirical lesson to proprietors and others, to beware of such temporary expedients; as, however cheap such fences may be in the first instance, in their bulk they are but imperfect, and in the end are the worst and most expensive of any. An equal defect, it is allowed, prevails in many instances where the inclosing fence is entirely of stone. When the walls, in place of having a good foundation sufficiently removed beyond the reach of frost, broad at bottom, tapering gradually upwards, and finished at top with a substantial coping of flag-stones and lime or turf, so formed as to prevent the decay of the building, are in many instances built upon the plain surface, with fearce any taper towards the top, and without any coping at all, except perhaps a slight one of turf, which soon moulders away, and, if the wall is built with lime or clay, permits the molyure to soak down and destroy it. The fame improvidence and want of judgment discovers itself in carrying these walls through every kind of soil, wet as well as dry. In the formation of extensive inclosures, it very often happens that a part of the land in which the inclosing fence is to run is wet and spongy; in place of paying attention to that circumstance, disconinuing the wall where the dry land terminates, and either attempting to lay the spongy parts dry by draining, or plant a hedge of willows, poplars, or other plants adapted to wet soils upon the surface, the wall is too frequently continued through the whole. The consequence (as may very naturally be expected) is, that the wall, for want of a solid dry foundation, soon tumbles down, or is continually needing repairs. Along with this inattention to the shape of walls, considerabe lods arize from building them with round, or what are termed land-foles. These, from their shape, are incapable of preventing a sufficient extent of surface to each other to bind them, or give stability to the building, by which means it seldom lasts long, though clay, or even lime is made use of. The practice of mixing clay is particularly inexpedient, as in general the frit winter’s frot, or a long continued feries of wet weather, faturates the clay fo completely, that the wall swells, burfts, and is thrown down. And the practice of inclosing with the different kinds of dead hedges and palings is producive of equal lods both to individuals and the community. Were these fences made to answer only a temporary purpofe, such as protecting a young hedge, &c. &c. the lods would not be great, as their original value is small, and, long before they were totally decayed, the hedges they were meant to protect would be fo far advanced, as to make good fences without their affittance. From the perusal of the different reports, however, it appears that in many of the English counties they are retorted to in cafes where permanent plans of inclosing are intended, and are the only fence made use of. The surveyors who have noticed the practice are unanimous in their disapprobation of it, and reprefe the fences as perishable, and in the highest degree expensive. In several whole districts, dead hedges of different kinds form the only fence, and occasion an annual expence upon the property so inclosed, amounting from a fifth to a tenth part of the rent. Nearly an equal lods and expence is incurred in inclosing with paling; and what adds to the regret that arises from the obfervation of this ruinous practice is, the soil and climate in most cafes where it prevails are well calculated for the growth of live fences. It is evident that what is said above will be considered by the public at large as a reproach, and will be felt as such by those concerned. We admit that the feelings of individuals ought, in every instance where it is compatible with the public welfare, be respected; but where either their opinions or pracitices are hurtful to the country, or hostile to its improvement, they are justly reprehensible. Forborne in such cafes is vice; and though exposing their faults may, in some instances, cover them with shame, yet the talk is necessary; and by fixing the attention of the public upon the subject, has very often the effect of preventing the most serious abuses and bringing about valuable improvements.

When wet ditches constitute the fence, either in their natural flat, or as making a component part of another fence, such as ditch and hedge, &c. due attention has in very few instances been paid to secure every advantage that might be derived from their use. Proceeding without judgment,
INCLOSEING OF LAND.

Judgment, the ditches in many counties are made equally deep and wide upon wet and dry lands, from an erroneous opinion, that the drainage of the field, and the future prosperity of the hedges, require a ditch of certain dimensions. In place of laying off the field in such a ditch as to make the ditches subservient to the purposes of drainage as well as inclosure, they are frequently dug at random, of an uncommon depth and width, with a high bank or mound of earth on the side next the field, so strong and thick that no water can find its way through it. In that way the ditch, in place of acting as an open drain for carrying off the water from the adjacent fields, acts as a kind of barrier to prevent it from getting away; while, from the want of a proper level and outlet, when once filled it becomes a kind of resevoir; and by continuing filled with water three parts of the year, chills the roots of the inclosing hedge plants so much, that they either perish entirely, or remain small, twisted, and diseased. In this place it may be necessary to observe, that the use of ditches as open drains has in many instances been completely misused. In most of the old inclosures they were thought valuable only in proportion to the quantity of water they were capable of containing, without considering whether they were so situated as to convey that water to a proper outlet. In the Reports of the counties of Ayr and Stirling, these deep and wide ditches are described, and their defects noticed: in the former county they are from six to eight feet wide, and of a proportionable depth; and in the latter, they are in many cases upwards of twelve feet wide. The quantity of valuable ground occupied in that way, over such extensive districts, must be immense; and when to this is added the injury done to the hedges from their roots being chilled, and the inconvenience arising from having a tract of country so much cut and intersected by these canals during winter, which prevents all passage through them, and the danger of weak hores or cattle, or even unfortunate travellers, who mistake their road in the dark, falling into them (circumstances which unfortunately too often occur), together with the expeence of making such deep excavations, it will readily appear that the practice is bad, and that every purpose both of drainage and inclosure might be answered, at perhaps a fourth part of the expense, and without any of the risks or inconveniences we have mentioned. See Fence and Hedge.

It is further remarked, that in many parts the defective method of rearing and managing the hedges is no less striking. In place of making the whole hedge of one kind of plants suited to the nature of the soil, and such as, when arrived at a certain age, are capable of making a good fence, the inclosure is frequently surrounded with a motley mixture of shrubs, many of which, even in their most perfect state, are unfit for making a fence; while others, though they might have answered the purpose pretty well if the whole fence had been made with them, yet, from the circumstance of their being mixed with others, which not only come into leaf, but also shake their leaves at a different season, both hurt each other's growth, are offensive to the eye, and take from the general appearance of the country. Such, however, are the fences in some parts of the finest counties in England, where, upon the top of a high bank that has been raised by robbing the adjoining ground of its soil, a motley hedge, confining of various plants, is met with, full of gaps filled up with stones or dead wood, forming a very insufficient fence, either for the purpose of confining the flock while the field is in pature, or of protecting the crops while it is under tillage. In other cases, when the plants of which the hedge consists are of one kind, it too often happens, that they are by means suited to the nature of the foil. For example, in inclosing a large field where a part of the line of fence is perfectly dry, and a part of it wet and swampy, in place of planting quicks or white-thorns upon the dry spaces, and willows, poplars, birches, or such plants as thrive in damp situations upon the wet parts, the whole field is often surrounded with thorns, greatly to the hurt of the proprietor and occupier; as upon the dry land the thorns thrive, and in a few years make a good fence, while upon the wet parts they either fail entirely or are good for nothing; whereas, with a little judgment in accommodating the plants to the foil, planting quicks upon the dry land, and willows, poplars, &c. upon the swampy and swampy parts, the whole would thrive, and there would be no defect in the line of inclosure. To this mistake (a want of judgment in accommodating the plants to the foil) are to be added the defects which commonly take place in the after-management and training of hedges. It is now well known, that the whole, or the greater part of the plants of which hedges are made, if left to themselves without pruning or weeding, run up to a considerable height, grow broad and bushy at top, and become open and naked at bottom. To prevent this there is no remedy known, but that of cutting over the main stems of the plants of which the hedge consists, after they have attained a certain height, and pruning or trimming the lateral branches in such a way as to preserve the hedge thick and broad at the bottom, and give it a gradual taper towards the top. But in place of this management, the hedge, in moist inclusions, after being planted, is abandoned to its fate, and neither weeding, pruning, nor indeed any other attention belittled upon it: in that way a number of the plants are either choked by weeds, or remain in a dwarf flushed state; and such as survive this usage are allowed to shoot up at random, and soon attain a great height without being useful as a fence, and by the spreading of their branches at top, not only become naked and open below, but cover three times the space of ground that hedges differently kept usually do.

It may be observed, in general, in regard to the directions of the inclosing fences, that they should run up the sides, and immediately across the tops of the elevations, by which their heights are in appearance considerably increased. But in some cases it may be better to carry them in an oblique manner across, as affording greater advantage in the direction of the ridges and in producing shelter and shade. They have in common the most beneficial effects in the level and valley lands, when they are placed in a parallel direction to the rising grounds, and when they intersect one another at right angles, and where the inclosures approach nearly to perfect squares. See Fence and Hedge.

In addition to the various advantages that have been already mentioned, the inclosing of land enables the farmer to act as is the most suitable and convenient in respect to the cultivation of his different crops, as well as to pursue various other plans of good husbandry that could not otherwise be attempted.

In cases where farms are to be inclosed, it will be advantageous to begin with having a survey and plan made, that they may thereby be divided and proportioned out with greater propriety and precision, so as to render them pleasing to the eye and convenient to the farmer; and if there be places of residence upon them, the whole of each may be made to become ornamental to the residences, by a judicious disposition of the hedges and plantations. And when there are different farms, they should be so divided, that
the dwelling of each tenant may be as contiguous to his land as convenience will admit of, in order to prevent length of carriage, and to facilitate attendance, labour, &c. See Waife Land.

INCognita, in Natural History, is a term which has frequently been applied to the animal and vegetable remains found imbedded in the dratate of the earth, from the circumstance of their not agreeing, when examined with sufficient care to minutely discriminate, with the known existing species to which they bear a resemblance in many instances; it has been thought by many late naturalists, that all the reliquies of the dratate are incognita, or belong to extinct and unknown races of organic beings, sometimes called the primitive creation, and the antediluvians, but not without propriety, because the animals and plants that existed before Noah's flood were of the very same kind as we now have.

INCognito, a term borrowed from the Italians, used when a person is in any place where he would not be known; but it is more particularly applied to princes, or great men, who enter towns, or walk the streets, without their ordinary train, or the usual marks of their distinction and quality; or when they travel without their proper titles.

The grandees in Italy make a common custom of walking the streets incognito; and always take it amiss, on such occasion, when people pay their compliments to them. It is not barely to prevent their being known that they take these measures, but because they would not be treated with ceremony, nor receive the honours due to their rank.

When the horses in princes, cardinals, and ambassadors coaches have no tassels, which they call gagli, and the curtains, which they call banderole, are drawn, they are reputed to be incognito; and nobody that meets them is obliged to stop, or make his honours to them.

The cardinals also, when they would be incognito, leave off the red hat.

INCOMBUSTIBLE, that which cannot be burnt or consumed.

Metals melt, floses calcine, and are yet incombusible. Cloth made of flax, amiantus (see Amiantus) has been deemed incombusible; it is cleansed by fire, but not burnt. See Amiantus, and Lineum Incombustible.

INCOMBUSTIBLE Linum, a name given by authors to a peculiar kind of asbestos, or earth flax, which never is formed intocompact masses as the other species are, but is always found in loose filaments, and of a very flexible nature, and extremely fit to work.

This is a kind of asbestos, wholly different from the species known to the ancients, and is found, so far as is yet known, only in the county of Aberdeen in Scotland, in the neighbourhood of Aberlour, near the Highlands. See Amiantus, and Lineum Incombustible.

The fabricating a cloth of this substance has not yet been attempted; but Mr. Wilton, who first discovered it, had some of it hemp-like yarn, which gives proof that the other is practicable. Phil. Trans. N. 276 p. 1085.

INCOMBUSTIBLE, Simple, in Chemistry, are those whose characteristic property is a strong tendency to unite to oxygen: the combination is not accompanied by the emission of heat and light; and the compounds formed are capable of supporting combustion. (See SUPPORTERS.) Only two substances possess this character, namely, Azot and Muriatic Acid, which fee.

INCOMBUSTIBLE Wood, in Natural History. Dr. Grew, in his Catalogue of the Rarities in Gresford College, p. 269, mentions pieces of wood half petrified, which held in the fire become red like a coal, but do not flame or smoke.

INCOMMENSURABLE, a term in Geometry, used where two lines, when compared to each other, have no common measure, how small soever, that will exactly measure them both.

In the general, two quantities are said to be incommensurable, when no third quantity can be found that is an aliquot part of both; or, when those quantities are not to one another as unity to a rational number; or as one rational number to another. See COMMENSURABLE.

The side of a square is incommensurable to the diagonal, as is demonstrated by Euclid; but it is incommensurable in power, the figure of the diagonal being equal to twice the figure of the side.

Pappus, lib. iv. prob. 17, speaks also of incommensurable angles. Surfaces which cannot be measured by a common surface, are also said to be incommensurable in power. See DIOPHANTINE PROBLEMS.

INCOMPATIBLE, that which cannot subsist with another without destroying it.

Thus, cold and heat are incompatible in the same subject; the strong and the weak cannot exist in the same person.

INCOMPOSIT, in Mu£er, is a term used by Euclid to express such intervals in certain Greek scales of music, as if reformed or were required to make up the whole diatessaron or minor fourth. In the chromatic mode, the incompressible interval, which, with two TETRANTAL DIFFERENCES (see that article), is required to complete the tetrachord, being the difference between a fourth and a third of a major tone, is $18^4_2 + \frac{1}{2} f + 16 m$, or $18^4_4 + 16 f + 16 m$, its common logarithm is $0.291629.4502$, and in those of Euler or decimals of the octaves $0.30755$, and it contains $16.35777$ major commas. According to Holder's treatise, 1st edit. p. 101, this incompressible interval was rated by Euclid to consist of a major tone and half and a third part of a tone,” which is $17T$, but this is $192.629716 + 4 f + 16 m$, and differs more than half a comma from the above, and is one among the many inferences in which it will appear, that even this prince of mathematicians had but imperfect ideas of the comparative values of furl or fractional musical intervals, to which the modern invention of logarithms has opened up a road. See INTERVAL.

INCOMPoSIT of the Chromatic Solféjum, in the Greek Music, is the excess of the fourth above one-sixth part of a major tone, which in Mr. Farey's notation is $219^2_2 + \frac{1}{2} f + 19 m$, or $219.532222 + \frac{1}{2} f + 19 m$, its common logarithm is $0.291241.4220$, its Euler's logarithm is $-0.357697$, and it contains $14.99794$ major commas. Euclid is said to have represented this incompressible interval as being seven of his drachma quadrinata, or $117$, which, however, is $182.672864 + 3 f + 16 m$, and consequently differs more than three commas from it: another inference of what has been observed above. See INTERVAL.

INCOMPoSIT of the Diatonic Mollé, is the excess of the fourth above $1$ major tone, which is $72 + \frac{1}{2} f + 61 m$, or $71.971362 + \frac{1}{2} f + 6 m$; its common logarithm is $0.645781.77567$, and its Euler's or binary log. is $-1.17671$, and it contains $6.46943$ major commas. Euclid states this to be equal to three quadrantals, but which is $27_7$, or $5780.72865$
The text contains a mix of mathematical equations and medical terminology, including references to Euclid's prime numbers and Euler's number. The content discusses various mathematical and medical concepts, such as harmonic numbers, intervals, and the effects of operations on the bladder and urethra. The text touches on topics like incontinence, urinary function, and the medical implications of mathematical ratios.
In cases where the weakness or paralysis of the sphincter vesice is altogether a local affection, the internal and external employment of tonics and stimulants is indicated. The following plans and remedies are said to have been used with success:—bathing the feet and parts about the pubes with cold water; introducing cold injections into the bladder; laying in the vagina a sponge, which has been filled with cold water; pumping cold spring water upon the pubes and perineum; given, every four hours, half a drachm of alum with ten grains of gum arabic; using as a lotion, which is to be applied externally, or within the vagina by means of a sponge, a liquor composed of wine, brandy, and a decoction of allrangent herbs; exhibiting bark internally; applying a blister upon the factum, or perineum, repeatedly; giving from fifteen to thirty drops of the tincture of cantharides with some lac amygicale; placing the parts about the pubes in a flower bath; electricity; frequently rubbing the spine and facrum with a stimulating liniment, composed of cocoa, butter, and the oils of lavender and nutmeg, or else of hartshorn and spiritus feryllis; administerling chalybeates, &c.

Whenever the weakness or paralysis of the sphincter vesice occurs, merely as a symptom of another disease, the first indication is to endeavour to remove this last affection; and then if the paralysis of the sphincter should continue, the surgeon is to try some of the preceding tonic and stimulating remedies.

The long enumeration which we have given of methods which have been practiced with success, may be likely to create indecision, with respect to such plans as claim the preferrence. We have no hesitation, then, in declaring our belief, that the records of surgery, and the leisons of daily experience, are most strongly in favour of applying blisters to the factum, and bathing the region of the pubes, and the perineum with cold spring water. The efficacy of blisters, in this species of the disorder, is frequently displayed in a series of successful cases, related in the Medical Observations and Inquiries. We have also a high opinion of the internal employment of the tincture of cantharides, with bark and leaf medicines, especially when aided by electricity, or friction of the spine and facrum with a stimulating liniment.

When the disororder proves incurable, the surgeon always has it in his power to recommend some apparatus for lessening the inconveniences with which the patient is annoyed. A thing which answers the purpose in male subjects, is a sort of flasks or bottles, which is to be placed in such a manner that the urine may run into it, by which means all bad smell, uncleanliness, and wetness will be avoided. The flask must also be so put on as not to be irksome to the patient when he moves about. That which is described in Juville's Traité des Bandages, consists of three pieces; namely, an ivory mouth, an elastic gum-neck, and a silver body. The vessel is fastened by means of tape to a leathern girt, which goes round the waist. The ivory mouth is round, and about eight inches in breadth. Its external margin is furnished with several small apertures, through which the tapes are intended to pass. Its inner surface is slightly excavated, so that it fits more exactly on the parts about the pubes. Its external surface is a little convex, and provided with a projecting arm, which is here and there perforated, and is designed for having the elastic gum-neck attached to it.

The neck of the apparatus must be made of a single piece of elastic gum, without any seam, about four or five inches long, and of sufficient breadth to contain the penis. The lower end of this tube is screwed to the silver body of the instrument. At the top of the screw part of the body are three pins, which internally cross each other, in the form of a star, and are intended to support a bit of sponge that is put within the neck. In the silver receptacle is a funnel, the lower end of which is furnished with a valve. The silver part of the instrument is flat, four inches broad, and when the apparatus is put on, always lies at the inside of the thigh, in a small pocket made in the patient's breeches for its reception. The sponge, in the elastic tube, and the valvular funnel, in the silver receptacle, effectually prevent any return and escape of the urine, which would otherwise happen when the patient raises his thigh, or sits down. When the body of the instrument is full, it is to be screwed off, and emptied; nor is there the least occasion to take off the whole of the apparatus. On certain occasions the patient, if he chooses, can screw on a receptacle of larger size.

It has been objected to instruments of the preceding description, that they cannot be constantly retained upon the part, taken off and on, and carried about by the patient, without great trouble and inconvenience. Hence some surgeons have given the preference to an instrument, whereby the penis and urethra may be gently compressed, fo as to retain the urine in the bladder, and discharge it, by day or night, at pleasure, (as is asserted,) with little more trouble than in the ordinary way, by opening and shutting the little, light, and easy instrument called a yoke. Nuck was the inventor of a famous contrivance of this kind, which is represented in the plates of Heifler's System of Surgery, together with another yoke, devised by the latter practitioner himself. See Tab. 26. Figs. 8, and 9.

It is justly remarked by modern writers, that the jugum penis hardly admits of being worn when there is a tendency to erections; and, in other cases, the machine is always apt either to make too little pressure, so as not to restrain the urine, or else too much, so as to produce pain.

To female patients, the foregoing contrivances are, of course, totally unadapted, and, in this sex, it is somewhat difficult to obviate and diminish the inconveniences arising from an incontinence of urine. Sponge, which has commonly been introduced into the vulva, is of little use, for it must be taken out, and replaced again, exceedingly often, or else, in consequence of its becoming quickly full of urine, this fluid runs down as fast as if no means at all were taken to hinder such annoyance. Besides, when the patient sits down, the urine is partly pressed out of the sponge, and, making its escape, wets the clothes, and causes much uncleanliness. This circumstance led to the idea of compressing the female urethra against the os pubis, so as to close the passage, and several instruments for this purpose have been invented and recommended. One of the simplest instruments of this fort is a pelluary, which is made very convex on the side towards the os pubis, so as to compress the meatus urinarius against this bone; and, in order that the pressure may neither be too powerful nor too feebd, we are particularly advised to employ peffaries made of elastic gum.

Default assures us, that the objects in view are best fulfilled by an instrument, which has a steel spring, resembling that of a common truss, and extending round the pelvis. In the middle of the spring, precisely over the symphysis pubis, is a metallic plate, from which proceeds downwards a long, narrow, somewhat curved piece of steel, on the
Lower end of which is fixed a pad, designed for pressing the meatus urinarius against the os pubis. In order that the degree of pressure may be more easily regulated, the long fixed branch may be constructed with a hinge, or joint, at its middle. The upper part of this piece of feel ought to project a little beyond the lower portion, so as to allow a screw to be placed in it, whereby the lower part of feel, and the pad belonging to it, may be pressed, in the requisite manner, towards the os pubis. (See Journal de Médecine, tom. iii.) A similar, but apparently a still more commodious instrument of this kind, is described by Le Rouge in the Journal de Médecine, Chimurgie, et Pharmacie, tom. ixxvii. p. 459.

Experience alone can determine whether such inventions will answer the intended purpose. Richter apprehends, that the constant pressure must, at length, prove painful, and that, if it were not strong, it could not hinder the urine from escaping. Realists of this fort have induced some writers to recommend the employment of a flask, or receptacle for the urine, as well for female as male patients. An apparatus has been invented, consisting of a bandage, that passes round the body, and is provided with an elastic piece of feel which descends over the mean veneris, and presses an oblong tin funnel against the orifice of the meatus urinarius. A bit of sponge is placed within the funnel, and projects a little over its edge, being calculated to be upon the opening of the urethra, imbibe the urine, and conduct it into the funnel, from which it drops into a bladder, or skin pouch, purposefully placed for its reception. (Botticher, vom Chirurgischen Verbande.) As the preceding apparatus must, in all probability, put the patient to inconvenience when the fits down, Richter suspects, that it might be bett to introduce into the urethra a flexible catheter, the lower end of which is to be fastened to the patient's flask, after being properly fixed in the manner described in speaking of the latter apparatus. The receptacle can easily be retained on the inside of the thigh.

Having treated of the incontinence of urine, attended with a paralyzis of the sphincter vesice, we shall next speak of that species of the disorder which has been called prostatism, and usually arises from the operation of some irritation or another upon the bladder. In a case of this nature, it is always a chief indication to discover and remove, if possible, the active irritation, which, according to surgical authors, may be of several kinds: worms, hemorrhoids, cold, suppuration of the menpes, a calculus in the bladder, an abscess near the anus, &c. The treatment must, of course, be subject to considerate variety. When the particular nature of the irritation cannot be determined, the practicier must employ general anodyne and antispasmodic remedies, opium, the warm bath, &c. In these cases, the uva ursi has been prescribed with infinite advantage. The present fort of incontinence of urine occasionally occurs merely as a symptom of epilepsy, hysteria, &c. In this circumstance, the treatment is to be entirely directed against the original disease. The disorder is frequently produced by pressure on the bladder, and therefore we see it brought on by polyph of the uterus, pregnancy, or a defect of the womb.

The third species of incontinence of urine, or that to which patients are only subject in the night-time, cannot always be regarded as a disease. In young subjects, the case is usually one of the three following kinds: the boy either neglects to get up, when he feels an inclination to make water; or he isleps so soundly, that he is utterly insensible of the calls of nature; or likely, he dreams that he is making use of a chamber-pot, and empties his bladder, as it were, voluntarily. The fault of these cases requires proper advice, and, if that will not do, moderate chastisement. The second, it would certainly be the height of absurdity and cruelty to endeavour to obviate by corporal punishment; it is a true incontinence, incidental to childhood, and commonly disappearing as the boy grows a little older. The application of punishment to the third instance is likewise quite irrational and improper. Children liable to the nocturnal incontinence of urine, ought rather to be kept from drinking too late in the evening, and care should always be taken to make them use the chamber-pot before they are put into bed. The children also, if possible, should be waked in the course of the night, in order that they may make water.

When adults are troubled with the incontinence, or children continue afflicted, notwithstanding the trial of ordinary plans, a quarter of a grain of the pulv. cantharid. may be administered, every evening, in some milk of almonds. When this plan fails, we have reason to suspect, that the incontinence of urine is owing to the operation of a preternatural irritation on the bladder. In this circumstance, if relief is to be derived from medicines, it must be from such as opium and ipecacuanha.

In obinate cases, it has been suggested, that benefit might be derived from advising the patient to retain his urine a good deal in the day-time, by which means the bladder, being accustomed to hold a considerable quantity of fluid, would not be so prone to contract in the night-time for the expulsion of a small quantity. Should all the above methods prove ineffectual, the only resource left is to put on the patient, just before bed-time, one of the machines already described in a previous part of the present article.

In the particular case, where a fibrous communication exists between the bladder and vagina, in consequence of ulceration, or sloughing, if the aperture will not heal by making the patient lie a good deal on the abdomen, we may scurry the sides of the opening, and endeavour to make them unite with a future. Perhaps, in some instances, the opening might be healed by touching it with cautery, making the patient lie upon her abdomen, and keeping a catinier, as much as possible, in the urethra.

INCONTINENCY, in a moral sense, is of divers kinds; as in cases of bigamy, rapes, sodomy, or buggery, getting baltards; all which are punished by statute. See 25 Hen. VIII. cap. 6. 18 Eliz. cap. 7. 1 Jac. I. cap. 11. Incontinency of priests is punishable by the ordinary, by imprisonment, &c. 1 Hen. VII. cap. 4.

INCORPORATION, formed from in, and corpus, body, the mixing the particles of different bodies together, in order to make an uniform substance or composition of the whole, without leaving any possibility of discerning the ingredients or bodies mixed, in any of their particular qualities.

INCORPORATION, in Law. See CORPORATION.

INCORPOREAL, SPIRITUAL; a thing, or substance, which has no body. See SPIRIT and BODY.

Thus the soul of man is incorporeal, and may subsist independently of the body. See SOUL.

Those ideas which are independent of bodies, can neither be corporeal themselves, nor be received within a corporeal subject: they discover to us the nature of the soul, which receives within itself what is incorporeal, and receives it in a corporeal manner too; whereas it is, that we have incorporeal ideas even of bodies themselves. Fenelon.

INCORPOREAL Inheritance, in Law. See INHERITANCE.
INCORRUPTIBLE, that which cannot be corrupted. See Corruption.

Thus spiritual substances, as angels, human souls, &c. and thus also glass, gold, mercury, &c. may be called incorruptible.

INCORRUPTIBLES, Incorruptibles, the name of a sect which sprang out of the Eutychians.

Their distinguishing tenet was that the body of Jesus Christ was incorruptible; by which they meant, that after and from the time wherein he was formed in the womb of his holy mother, he was not susceptible of any change or alteration; not even of any natural and innocent passions, as of hunger, thirst, &c. so that he eat without any occasion, before his death, as well as after his resurrection. And hence it was that they took their name.

INCRASSANTS, or Incrassating Medicines, in the language of the old writers, and of the humoral pathology, such medicines as were imagined to condense or thicken the blood and humours, which were of a morbidly thin or fluid consistence. Both the diseased condition, and the operation of medicines upon the fluids, were probably equally gratuitous. See Humoral Pathology.

INCREASING FAULT, in Mining, is applied by Mr. Farey in his Report on Derbyshire, vol. i. p. 122, to describe those dislocations of the strata, which are not alike in all parts of the same fault, but increase in proceeding one way along the fault, and decrease, or derange the measures, a less number of fathoms, yards, feet, &c. in proceeding in a contrary direction: the phenomena attending this important class of faults, are described in the volume above quoted, and their application to mineral surveying is shown.

INCREMENT, Incrementum, in Rhetoric, a species of climax, gradually rising from the lowest to the highest. Such as that of Seneca: "Turpissima tamen est jactura, qua per negligentiam venit: et, si volueris attendere, magna vita: pars elabitur male agentibus, maxima nihil agentibus, tota aliud agentibus." See Climax.

END OF VOL. XVIII.
